ATTN: Ms. Betsy Cutie

December 31, 2014

SUBJECT: DoDHF Novato, CA, Data Validation

Dear Ms. Cutie,

Enclosed are the final validation reports for the fractions listed below. These SDGs were received on December 10, 2014. Attachment 1 is a summary of the samples that were reviewed for each analysis.

LDC Project #33263:

SDG #	Fraction
BMI14111205, BMI14111302 BMI14111401, BMI14111760	Volatiles, Dissolved Iron, Wet Chemistry

The data validation was performed under EPA Level III & IV guidelines. The analyses were validated using the following documents, as applicable to each method:

- USEPA Contract Laboratory Program National Functional Guidelines for Superfund Data Review, June 2010
- USEPA Contract Laboratory Program National Functional Guidelines for Inorganic Superfund Data Review, January 2010
- EPA SW 846, Third Edition, Test Methods for Evaluating Solid Waste, update 1, July 1992; update IIA, August 1993; update II, September 1994; update IIB, January 1995; update III, December 1996; update IIIA, April 1998; IIIB, November 2004; Update IV, February 2007

Please feel free to contact us if you have any questions.

Sincerely,

Pei Geng
Project Manager/Senior Chemist

HC

**Indicates sample underwent EPA Level IV review

Introduction

This data review covers 16 water samples listed on the cover sheet including dilutions and reanalysis as applicable. The analyses were per EPA SW 846 Method 8260B for Volatiles (Short List).

This review follows a modified outline of the USEPA Contract Laboratory Program National Functional Guidelines for Superfund Data Review (June 2010).

A qualification summary table is provided at the end of this report if data has been qualified. Flags are classified as P (protocol) or A (advisory) to indicate whether the flag is due to a laboratory deviation from a specified protocol or is of technical advisory nature.

Samples indicated by a double asterisk on the front cover underwent an EPA Level IV review. An EPA Level III review was performed on all of the other samples. Raw data were not evaluated for the samples reviewed by EPA Level III criteria since this review is based on QC data.

The following are definitions of the data qualifiers:

U Indicates the compound or analyte was analyzed for but not detected.

J Indicates an estimated value.

R Quality control indicates the data is not usable.

NJ Presumptive evidence of presence of the compound at an estimated quantity.

UJ Indicates the compound or analyte was analyzed for but not detected. The sample detection limit is an estimated value.

A Indicates the finding is based upon technical validation criteria.

P Indicates the finding is related to a protocol/contractual deviation.

None Indicates the data was not significantly impacted by the finding, therefore qualification was not required.

I. Technical Holding Times

All technical holding time requirements were met.

The chain-of-custodies were reviewed for documentation of cooler temperatures. All cooler temperatures met validation criteria.

II. GC/MS Instrument Performance Check

Instrument performance was checked at 12 hour intervals.

All ion abundance requirements were met.

III. Initial Calibration

Initial calibration was performed using required standard concentrations with the following exceptions:

Sample	Compound	Finding	Criteria	Flag	A or P
LEA-MW3** MW-M2-BR IT-MW-81D LEA-MW4 LEA-MW2 LEA-MW2-DUP MW-M14D MBLKMS15W1121A	tert-Butyl formate	A one point calibration was performed.	A five point calibration is specified by the method.	J (all detects) UJ (all non-detects)	P

Percent relative standard deviations (%RSD) were less than or equal to 15.0% for all compounds.

Average relative response factors (RRF) for all compounds were within method and validation criteria with the following exceptions:

Date	Compound	RRF (Limits)	Associated Samples	Flag	A or P
11/11/14	tert-Butyl alcohol	0.01302 (≥0.05)	LEA-MW3** MW-M2-BR IT-MW-81D LEA-MW4 LEA-MW2 LEA-MW2-DUP MW-M14D MBLKMS15W1121A	J (all detects) UJ (all non-detects)	A

IV. Continuing Calibration

Continuing calibration was performed at the required frequencies.

Percent differences (%D) between the initial calibration RRF and the continuing calibration RRF were within the method criteria of less than or equal to 20.0% for all compounds with the following exceptions:

Date	Compound	%D	Associated Samples	Flag	A or P
11/21/14	tert-Butyl alcohol	24.1	LEA-MW3** MW-M2-BR IT-MW-81D LEA-MW4 LEA-MW2 LEA-MW2-DUP MW-M14D MBLKMS15W1121A	J (all detects) UJ (all non-detects)	A

The percent differences (%D) of the second source calibration standard were less than or equal to 20.0% for all compounds.

All of the continuing calibration relative response factors (RRF) were within method and validation criteria with the following exceptions:

Date	Compound	RRF (Limits)	Associated Samples	Flag	A or P
11/21/14	tert-Butyl alcohol	0.016 (≥0.05)	LEA-MW3** MW-M2-BR IT-MW-81D LEA-MW4 LEA-MW2 LEA-MW2-DUP MW-M14D MBLKMS15W1121A	J (all detects) UJ (all non-detects)	A

V. Blanks

Method blanks were reviewed for each matrix as applicable. No volatile contaminants were found in the method blanks.

Sample 11112014-EB was identified as an equipment blank. No volatile contaminants were found.

VI. Surrogate Spikes

Surrogates were added to all samples and blanks as required by the method. All surrogate recoveries (%R) were within QC limits.

VII. Matrix Spike/Matrix Spike Duplicates

Matrix spike (MS) and matrix spike duplicate (MSD) samples were reviewed for each matrix as applicable. Percent recoveries (%R) and relative percent differences (RPD) were within QC limits.

VIII. Laboratory Control Samples (LCS)

Laboratory control samples were reviewed for each matrix as applicable. Percent recoveries (%R) were within QC limits.

IX. Regional Quality Assurance and Quality Control

Not applicable.

X. Internal Standards

All internal standard areas and retention times were within QC limits.

XI. Target Compound Identifications

All target compound identifications were within validation criteria for samples on which an EPA Level IV review was performed. Raw data were not evaluated for the samples reviewed by EPA Level III criteria.

XII. Compound Quantitation

All compound quantitation were within validation criteria on which an EPA Level IV review was performed. Raw data were not evaluated for the samples reviewed by EPA Level III criteria.

XIII. Tentatively Identified Compounds (TICs)

Tentatively identified compounds were not reported by the laboratory.

XIV. System Performance

The system performance was acceptable for samples on which an EPA Level IV review was performed. Raw data were not evaluated for the samples reviewed by EPA Level III criteria.

XV. Overall Assessment of Data

Data flags are summarized at the end of the report if data has been qualified.

XVI. Field Duplicates

Samples MW-M24 and MW-M24-DUP and samples LEA-MW2 and LEA-MW2-DUP were identified as field duplicates. No volatiles were detected in any of the samples with the following exceptions:

Compound	Concentration (ug/L)		RPD (Limits)
	LEA-MW2	LEA-MW2-DUP	
tert-Butyl alcohol	25	24	4 (≤35)
Methyl-tert-butyl ether	50	55	10 (≤35)

Method: Volatiles (EPA SW 846 Method 8260B)

Validation Area	Yes	No	NA	Findings/Comments
I. Technical holding times				
All technical holding times were met.	✓			
Cooler temperature criteria was met.	✓			
II. GC/MS Instrument performance check				
Were the BFB performance results reviewed and found to be within the specified criteria?	✓			
Were all samples analyzed within the 12 hour clock criteria?	✓			
III. Initial calibration				
Did the laboratory perform a 5 point calibration prior to sample analysis?	✓	✓		
Were all percent relative standard deviations (%RSD) and relative response factors (RRF) within method criteria for all CCCs and SPCCs?	✓			
Was a curve fit used for evaluation?		✓		
Did the initial calibration meet the curve fit acceptance criteria of ≥ 0.990?			✓	
Were all percent relative standard deviations (%RSD) ≤ 30%/15% and relative response factors (RRF) > 0.05?		✓		
IV. Continuing calibration				
Was a continuing calibration standard analyzed at least once every 12 hours for each instrument?	✓			
Were all percent differences (%D) and relative response factors (RRF) within method criteria for all CCCs and SPCCs?	✓			
Were all percent differences (%D) ≤ 20% and relative response factors (RRF) ≥ 0.05?		✓		
V. Blanks				
Was a method blank associated with every sample in this SDG?	✓			
Was a method blank analyzed at least once every 12 hours for each matrix and concentration?	✓			
Was there contamination in the method blanks? If yes, please see the Blanks validation completeness worksheet.		✓		
VI. Surrogate spikes				
Were all surrogate %R within QC limits?	✓			
If the percent recovery (%R) for one or more surrogates was out of QC limits, was a reanalysis performed to confirm samples with %R outside of criteria?			✓	
VII. Matrix spike/Matrix spike duplicates				
Were a matrix spike (MS) and matrix spike duplicate (MSD) analyzed for each matrix in this SDG? If no, indicate which matrix does not have an associated MS/MSD. Soil / Water.	✓			
Was a MS/MSD analyzed every 20 samples of each matrix?	✓			
Were the MS/MSD percent recoveries (%R) and the relative percent differences (RPD) within the QC limits?	✓			
VIII. Laboratory control samples				
Was an LCS analyzed for this SDG?	✓			

DC #: 33263A1

VALIDATION FINDINGS CHECKLIST

Reviewer: BR

2nd Reviewer:

Validation Area	Yes	No	NA	Findings/Comments
Was an LCS analyzed per analytical batch?	✓			
Were the LCS percent recoveries (%R) and relative percent difference (RPD) within the QC limits?	✓			
IX. Regional Quality Assurance and Quality Control				
Were performance evaluation (PE) samples performed?		✓		
Were the performance evaluation (PE) samples within the acceptance limits?			✓	
X. Internal standards				
Were internal standard area counts within -50% or +100% of the associated calibration standard?	✓			
Were retention times within ± 30 seconds of the associated calibration standard?	✓			
XI. Target compound identification				
Were relative retention times (RRT's) within ± 0.06 RRT units of the standard?	✓			
Did compound spectra meet specified EPA "Functional Guidelines" criteria?	✓			
Were chromatogram peaks verified and accounted for?	✓			
XII. Compound quantitation/RLs				
Were the correct internal standard (IS), quantitation ion and relative response factor (RRF) used to quantitate the compound?	✓			
Were compound quantitation and RLs adjusted to reflect all sample dilutions and dry weight factors applicable to level IV validation?	✓			
XIII. Tentatively identified compounds (TICs)				
Were the major ions (> 10 percent relative intensity) in the reference spectrum evaluated in sample spectrum?		✓		
Were relative intensities of the major ions within ± 20% between the sample and the reference spectra?			✓	
Did the raw data indicate that the laboratory performed a library search for all required peaks in the chromatograms (samples and blanks)?			✓	
XIV. System performance				
System performance was found to be acceptable.	✓			
XV. Overall assessment of data				
Overall assessment of data was found to be acceptable.	✓			
XVI. Field duplicates				
Field duplicate pairs were identified in this SDG.	✓			
Target compounds were detected in the field duplicates.	✓			
XVII. Field blanks				
Field blanks were identified in this SDG.	✓			
Target compounds were detected in the field blanks.		✓

METHOD: GC/MS VOA (EPA SW 846 Method 8260B)

The Relative Response Factor (RRF), average RRF, and percent relative standard deviation (%RSD) were recalculated for the compounds identified below using the following calculations:

$RRF = (A_x)(C_{is})/(A_{is})(C_x)$

average RRF = sum of the RRFs/number of standards

%RSD = 100 * (S/X)

A_x = Area of Compound

C_x = Concentration of compound,

S= Standard deviation of the RRFs,

A_{is} = Area of associated internal standard

C_{is} = Concentration of internal standard

X = Mean of the RRFs

#	Standard ID	Calibration Date	Compound (IS)	Reported RRF (5 std)	Recalculated RRF (5 std)	Reported Average RRF (Initial)	Recalculated Average RRF (Initial)	Reported %RSD	Recalculated %RSD

**Indicates sample underwent EPA Level IV review

Introduction

This data review covers 9 water samples listed on the cover sheet including dilutions and reanalysis as applicable. The analyses were per EPA Method 200.8 for Dissolved Iron.

This review follows a modified outline of the USEPA Contract Laboratory Program National Functional Guidelines for Inorganic Superfund Data Review (January 2010).

A qualification summary table is provided at the end of this report if data has been qualified. Flags are classified as P (protocol) or A (advisory) to indicate whether the flag is due to a laboratory deviation from a specified protocol or is of technical advisory nature.

Samples indicated by a double asterisk on the front cover underwent an EPA Level IV review. An EPA Level III review was performed on all of the other samples. Raw data were not evaluated for the samples reviewed by EPA Level III criteria since this review is based on QC data.

The following are definitions of the data qualifiers:

U Indicates the compound or analyte was analyzed for but not detected.

J Indicates an estimated value.

R Quality control indicates the data is not usable.

NJ Presumptive evidence of presence of the compound at an estimated quantity.

UJ Indicates the compound or analyte was analyzed for but not detected. The sample detection limit is an estimated value.

A Indicates the finding is based upon technical validation criteria.

P Indicates the finding is related to a protocol/contractual deviation.

None Indicates the data was not significantly impacted by the finding, therefore qualification was not required.

I. Technical Holding Times

All technical holding time requirements were met.

The chain-of-custodies were reviewed for documentation of cooler temperatures. All cooler temperatures met validation criteria.

II. ICPMS Tune

The mass calibration was within 0.1 AMU and the percent relative standard deviation (%RSD) was less than or equal to 5%.

III. Calibration

An initial calibration was performed.

The frequency and analysis criteria of the initial calibration verification (ICV) and continuing calibration verification (CCV) were met.

IV. Blanks

Method blanks were reviewed for each matrix as applicable. No dissolved iron was found in the initial, continuing and preparation blanks.

No field blanks were identified in this SDG.

V. ICP Interference Check Sample (ICS) Analysis

The frequency of analysis was met.

The criteria for analysis were met.

VI. Matrix Spike Analysis

Matrix spike (MS) and matrix spike duplicate (MSD) samples were reviewed for each matrix as applicable. Percent recoveries (%R) and relative percent differences (RPD) were within QC limits.

VII. Duplicate Sample Analysis

The laboratory has indicated that there were no duplicate (DUP) analyses specified for the samples in this SDG, and therefore duplicate analyses were not performed for this SDG.

VIII. Laboratory Control Samples (LCS)

Laboratory control samples were reviewed for each matrix as applicable. Percent recoveries (%R) were within QC limits.

IX. Internal Standards (ICP-MS)

All internal standard percent recoveries (%R) were within QC limits for samples on which an EPA Level IV review was performed. Raw data were not evaluated for the samples reviewed by EPA Level III criteria.

X. ICP Serial Dilution

ICP serial dilution was not performed for this SDG.

XI. Sample Result Verification

All sample result verifications were acceptable for samples on which an EPA Level IV review was performed. Raw data were not evaluated for the samples reviewed by EPA Level III criteria.

XII. Overall Assessment of Data

Data flags are summarized at the end of this report if data has been qualified.

XIII. Field Duplicates

Samples LEA-MW2 and LEA-MW2-DUP were identified as field duplicates. No dissolved iron was detected in any of the samples.

Method: Metals (EPA SW 846 Method 6010B/7000/6020)

Validation Area	Yes	No	NA	Findings/Comments
I. Technical holding times				
All technical holding times were met.	✓			
Cooler temperature criteria was met.	✓			
II. ICP/MS Tune				
Were all isotopes in the tuning solution mass resolution within 0.1 amu?	✓			
Were %RSD of isotopes in the tuning solution ≤5%?	✓			
III. Calibration				
Were all instruments calibrated daily, each set-up time?	✓			
Were the proper number of standards used?	✓			
Were all initial and continuing calibration verification %Rs within the 90-110% (80-120% for mercury) QC limits?	✓			
Were all initial calibration correlation coefficients ≥ 0.995?	✓			
IV. Blanks				
Was a method blank associated with every sample in this SDG?	✓			
Was there contamination in the method blanks? If yes, please see the Blanks validation completeness worksheet.		✓		
V. ICP Interference Check Sample				
Were ICP interference check samples performed daily?	✓			
Were the AB solution percent recoveries (%R) with the 80-120% QC limits?	✓			
VI. Matrix spike/Matrix spike duplicates				
Were a matrix spike (MS) and duplicate (DUP) analyzed for each matrix in this SDG? If no, indicate which matrix does not have an associated MS/MSD or MS/DUP. Soil / Water.	✓			
Were the MS/MSD percent recoveries (%R) and the relative percent differences (RPD) within the 75-125 QC limits? If the sample concentration exceeded the spike concentration by a factor of 4 or more, no action was taken.	✓			
Were the MS/MSD or duplicate relative percent differences (RPD) ≤ 20% for waters and ≤ 35% for soil samples? A control limit of +/- RL(+/-2X RL for soil) was used for samples that were ≤ 5X the RL, including when only one of the duplicate sample values were ≤ 5X the RL.	✓			
VII. Laboratory control samples				
Was an LCS anaylzed for this SDG?	✓			
Was an LCS analyzed per extraction batch?	✓			
Were the LCS percent recoveries (%R) and relative percent difference (RPD) within the 80-120% QC limits for water samples and laboratory established QC limits for soils?	✓			

Validation Area	Yes	No	NA	Findings/Comments
VIII. Internal Standards (EPA SW 846 Method 6020/EPA 200.8)				
Were all the percent recoveries (%R) within the 30-120% (6020)/60-125% (200.8) of the intensity of the internal standard in the associated initial calibration?	✓			
If the %Rs were outside the criteria, was a reanalysis performed?	✓			
IX. ICP Serial Dilution				
Was an ICP serial dilution analyzed if analyte concentrations were > 50X the MDL (ICP)/>100X the MDL(ICP/MS)?			✓	
Were all percent differences (%Ds) < 10%?			✓	
Was there evidence of negative interference? If yes, professional judgement will be used to qualify the data.			✓	
X. Sample Result Verification				
Were RLs adjusted to reflect all sample dilutions and dry weight factors applicable to level IV validation?	✓			
XI. Overall assessment of data				
Overall assessment of data was found to be acceptable.	✓			
XII. Field duplicates				
Field duplicate pairs were identified in this SDG.	✓			
Target analytes were detected in the field duplicates.		✓		
XIII. Field blanks				
Field blanks were identified in this SDG.		✓		
Target analytes were detected in the field blanks.			✓

VALIDATION FINDINGS WORKSHEET
Initial and Continuing Calibration Calculation Verification

Page: 1 of 1
Reviewer: JO
2nd Reviewer: [illegible]

METHOD: Trace Metals (EPA SW 846 Method 6010/6020/7000)

An initial and continuing calibration verification percent recovery (%R) was recalculated for each type of analysis using the following formula:

%R = Found x 100 / True

Where, Found = concentration (in ug/L) of each analyte measured in the analysis of the ICV or CCV solution
True = concentration (in ug/L) of each analyte in the ICV or CCV source

Standard ID	Type of Analysis	Element	Found (ug/L)	True (ug/L)	Recalculated %R	Reported %R	Acceptable (Y/N)
	ICP (Initial calibration)						
ICV 13:36	ICP/MS (Initial calibration)	Fe	5075.5 ug/L	5000 ug/L	101.5 %R	NR	n/a
	CVAA (Initial calibration)						
	ICP (Continuing calibration)

VALIDATION FINDINGS WORKSHEET
Level IV Recalculation Worksheet

Page: 1 of 1
Reviewer: SD
2nd Reviewer: 9

METHOD: Trace Metals (EPA SW 846 Method 6010/6020/7000)

Percent recoveries (%R) for an ICP interference check sample, a laboratory control sample and a matrix spike sample were recalculated using the following formula:

$\%R = \frac{Found}{True} \times 100$ Where, Found = Concentration of each analyte measured in the analysis of the sample. For the matrix spike calculation, Found = SSR (spiked sample result) - SR (sample result).
True = Concentration of each analyte in the source.

A sample and duplicate relative percent difference (RPD) was recalculated using the following formula:

$RPD = \frac{|S-D|}{(S+D)/2} \times 100$ Where, S = Original sample concentration
D = Duplicate sample concentration

An ICP serial dilution percent difference (%D) was recalculated using the following formula:

$\%D = \frac{|I-SDR|}{I} \times 100$ Where, I = Initial Sample Result (mg/L)
SDR = Serial Dilution Result (mg/L) (Instrument Reading x 5)

Sample ID	Type of Analysis	Element	Found / S / I (units)	True / D / SDR (units)	Recalculated %R / RPD / %D	Reported %R / RPD / %D	Acceptable (Y/N)

**Indicates sample underwent EPA Level IV review

Introduction

This data review covers 9 water samples listed on the cover sheet including dilutions and reanalysis as applicable. The analyses were per EPA Method 300.0 for Nitrate as Nitrogen and Sulfate.

This review follows a modified outline of the USEPA Contract Laboratory Program National Functional Guidelines for Inorganic Superfund Data Review (January 2010).

A qualification summary table is provided at the end of this report if data has been qualified. Flags are classified as P (protocol) or A (advisory) to indicate whether the flag is due to a laboratory deviation from a specified protocol or is of technical advisory nature.

Samples indicated by a double asterisk on the front cover underwent an EPA Level IV review. An EPA Level III review was performed on all of the other samples. Raw data were not evaluated for the samples reviewed by EPA Level III criteria since this review is based on QC data.

The following are definitions of the data qualifiers:

U Indicates the compound or analyte was analyzed for but not detected.

J Indicates an estimated value.

R Quality control indicates the data is not usable.

NJ Presumptive evidence of presence of the compound at an estimated quantity.

UJ Indicates the compound or analyte was analyzed for but not detected. The sample detection limit is an estimated value.

A Indicates the finding is based upon technical validation criteria.

P Indicates the finding is related to a protocol/contractual deviation.

None Indicates the data was not significantly impacted by the finding, therefore qualification was not required.

I. Technical Holding Times

All technical holding time requirements were met.

The chain-of-custodies were reviewed for documentation of cooler temperatures. All cooler temperatures met validation criteria.

II. Initial Calibration

All criteria for the initial calibration were met.

III. Continuing Calibration

Continuing calibration frequency and analysis criteria were met.

IV. Blanks

Method blanks were reviewed for each matrix as applicable. No contaminant concentrations were found in the initial, continuing and preparation blanks.

No field blanks were identified in this SDG.

V. Matrix Spike/Matrix Spike Duplicates

Matrix spike (MS) and matrix spike duplicate (MSD) analyses were reviewed for each matrix as applicable. Percent recoveries (%R) and relative percent differences (RPD) were within QC limits.

VI. Duplicates

The laboratory has indicated that there were no duplicate (DUP) analyses specified for the samples in this SDG, and therefore duplicate analyses were not performed for this SDG.

VII. Laboratory Control Samples

Laboratory control samples were reviewed for each matrix as applicable. Percent recoveries (%R) were within QC limits.

VIII. Sample Result Verification

All sample result verifications were acceptable for samples on which an EPA Level IV review was performed. Raw data were not evaluated for the samples reviewed by EPA Level III criteria.

IX. Overall Assessment of Data

Data flags are summarized at the end of this report if data has been qualified.

X. Field Duplicates

Samples LEA-MW2 and LEA-MW2-DUP were identified as field duplicates. No contaminant concentrations were detected in any of the samples with the following exceptions:

Analyte	Concentration (mg/L)		RPD (Limits)
	LEA-MW2	LEA-MW2-DUP	
Sulfate	59	60	2 (≤35)

Validation Area	Yes	No	NA	Findings/Comments
I. Technical holding times				
All technical holding times were met.	✓			
Cooler temperature criteria was met.	✓			
II. Calibration				
Were all instruments calibrated daily, each set-up time?	✓			
Were the proper number of standards used?	✓			
Were all initial calibration correlation coefficients ≥ 0.995?	✓			
Were all initial and continuing calibration verification %Rs within the 90-110% QC limits?	✓			
Were titrant checks performed as required? (Level IV only)			✓	
Were balance checks performed as required? (Level IV only)			✓	
III. Blanks				
Was a method blank associated with every sample in this SDG?	✓			
Was there contamination in the method blanks? If yes, please see the Blanks validation completeness worksheet.		✓		
IV. Matrix spike/Matrix spike duplicates and Duplicates				
Were a matrix spike (MS) and duplicate (DUP) analyzed for each matrix in this SDG? If no, indicate which matrix does not have an associated MS/MSD or MS/DUP. Soil / Water.	✓			
Were the MS/MSD percent recoveries (%R) and the relative percent differences (RPD) within the 75-125 QC limits? If the sample concentration exceeded the spike concentration by a factor of 4 or more, no action was taken.	✓			
Were the MS/MSD or duplicate relative percent differences (RPD) ≤ 20% for waters and ≤ 35% for soil samples? A control limit of ≤ CRDL(≤ 2X CRDL for soil) was used for samples that were ≤ 5X the CRDL, including when only one of the duplicate sample values were ≤ 5X the CRDL.	✓			
V. Laboratory control samples				
Was an LCS anaylzed for this SDG?	✓			
Was an LCS analyzed per extraction batch?	✓			
Were the LCS percent recoveries (%R) and relative percent difference (RPD) within the 80-120% (85-115% for Method 300.0) QC limits?	✓			
VI. Regional Quality Assurance and Quality Control				
Were performance evaluation (PE) samples performed?			✓	
Were the performance evaluation (PE) samples within the acceptance limits?			✓	

Validation Area	Yes	No	NA	Findings/Comments
VII. Sample Result Verification				
Were RLs adjusted to reflect all sample dilutions and dry weight factors applicable to level IV validation?	✓			
Were detection limits < RL?	✓			
VIII. Overall assessment of data				
Overall assessment of data was found to be acceptable.	✓			
IX. Field duplicates				
Field duplicate pairs were identified in this SDG.	✓			
Target analytes were detected in the field duplicates.	✓			
X. Field blanks				
Field blanks were identified in this SDG.		✓		
Target analytes were detected in the field blanks.			✓

The correlation coefficient (r) for the calibration of NO_3-N **was recalculated.Calibration date:** 7/23/14

An initial or continuing calibration verification percent recovery (%R) was recalculated for each type of analysis using the following formula:

%R = Found X 100 / True

Where, Found = concentration of each analyte measured in the analysis of the ICV or CCV solution
True = concentration of each analyte in the ICV or CCV source

Type of analysis	Analyte	Standard	Conc. (mg/L)	Area	Recalculated r or r^2	Reported r or r^2	Acceptable (Y/N)
Initial Calibration Verification	NO_3-N	0	0.125	0.018	*0.999972*	0.999186	y*
		s1	0.25	0.033			
		s2	0.5	0.084

METHOD: Inorganics, Method See Cover

Percent recoveries (%R) for a laboratory control sample and a matrix spike sample were recalculated using the following formula:

%R = Found x 100 / True Where, Found = concentration of each analyte measured in the analysis of the sample. For the matrix spike calculation, Found = SSR (spiked sample result) - SR (sample result).
True = concentration of each analyte in the source.

A sample and duplicate relative percent difference (RPD) was recalculated using the following formula:

RPD = |S-D| x 100 / (S+D)/2 Where, S = Original sample concentration
D = Duplicate sample concentration

Sample ID	Type of Analysis	Element	Found / S (units)	True / D (units)	Recalculated %R / RPD	Reported %R / RPD	Acceptable (Y/N)

**Indicates sample underwent EPA Level IV review

Introduction

This data review covers 19 water samples listed on the cover sheet including dilutions and reanalysis as applicable. The analyses were per EPA SW 846 Method 8260B for Volatiles (Short List).

This review follows a modified outline of the USEPA Contract Laboratory Program National Functional Guidelines for Superfund Data Review (June 2010).

A qualification summary table is provided at the end of this report if data has been qualified. Flags are classified as P (protocol) or A (advisory) to indicate whether the flag is due to a laboratory deviation from a specified protocol or is of technical advisory nature.

Samples indicated by a double asterisk on the front cover underwent an EPA Level IV review. An EPA Level III review was performed on all of the other samples. Raw data were not evaluated for the samples reviewed by EPA Level III criteria since this review is based on QC data.

The following are definitions of the data qualifiers:

U Indicates the compound or analyte was analyzed for but not detected.

J Indicates an estimated value.

R Quality control indicates the data is not usable.

NJ Presumptive evidence of presence of the compound at an estimated quantity.

UJ Indicates the compound or analyte was analyzed for but not detected. The sample detection limit is an estimated value.

A Indicates the finding is based upon technical validation criteria.

P Indicates the finding is related to a protocol/contractual deviation.

None Indicates the data was not significantly impacted by the finding, therefore qualification was not required.

I. Technical Holding Times

All technical holding time requirements were met.

The chain-of-custodies were reviewed for documentation of cooler temperatures. All cooler temperatures met validation criteria.

II. GC/MS Instrument Performance Check

Instrument performance was checked at 12 hour intervals.

All ion abundance requirements were met.

III. Initial Calibration

Initial calibration was performed using required standard concentrations with the following exceptions:

Sample	Compound	Finding	Criteria	Flag	A or P
IT-MW-92-38** MW-20D MW-21 NA-O MW-M14S IT-GMP-19 LEA-MW1 MBLKMS15W1124A	tert-Butyl formate	A one point calibration was performed.	A five point calibration is specified by the method.	J (all detects) UJ (all non-detects)	P

Percent relative standard deviations (%RSD) were less than or equal to 15.0% for all compounds.

Average relative response factors (RRF) for all compounds were within method and validation criteria with the following exceptions:

Date	Compound	RRF (Limits)	Associated Samples	Flag	A or P
11/11/14	tert-Butyl alcohol	0.01302 (≥0.05)	IT-MW-92-38** MW-20D MW-21 NA-O MW-M14S IT-GMP-19 LEA-MW1 MBLKMS15W1124A	J (all detects) UJ (all non-detects)	A

IV. Continuing Calibration

Continuing calibration was performed at the required frequencies.

Percent differences (%D) between the initial calibration RRF and the continuing calibration RRF were within the method criteria of less than or equal to 20.0% for all compounds.

The percent differences (%D) of the second source calibration standard were less than or equal to 20.0% for all compounds.

All of the continuing calibration relative response factors (RRF) were within method and validation criteria with the following exceptions:

Date	Compound	RRF (Limits)	Associated Samples	Flag	A or P
11/24/14	tert-Butyl alcohol	0.012 (≥0.05)	IT-MW-92-38** MW-20D MW-21 NA-O MW-M14S IT-GMP-19 LEA-MW1 MBLKMS15W1124A	J (all detects) UJ (all non-detects)	A

V. Blanks

Method blanks were reviewed for each matrix as applicable. No volatile contaminants were found in the method blanks.

Sample 11122014-EB was identified as an equipment blank. No volatile contaminants were found.

Samples 11112014-FB and 11122014-FB were identified as field blanks. No volatile contaminants were found.

VI. Surrogate Spikes

Surrogates were added to all samples and blanks as required by the method. All surrogate recoveries (%R) were within QC limits.

VII. Matrix Spike/Matrix Spike Duplicates

Matrix spike (MS) and matrix spike duplicate (MSD) samples were reviewed for each matrix as applicable. Percent recoveries (%R) and relative percent differences (RPD) were within QC limits.

VIII. Laboratory Control Samples (LCS)

Laboratory control samples were reviewed for each matrix as applicable. Percent recoveries (%R) were within QC limits.

IX. Regional Quality Assurance and Quality Control

Not applicable.

X. Internal Standards

All internal standard areas and retention times were within QC limits.

XI. Target Compound Identifications

All target compound identifications were within validation criteria for samples on which an EPA Level IV review was performed. Raw data were not evaluated for the samples reviewed by EPA Level III criteria.

XII. Compound Quantitation

All compound quantitation were within validation criteria on which an EPA Level IV review was performed. Raw data were not evaluated for the samples reviewed by EPA Level III criteria.

XIII. Tentatively Identified Compounds (TICs)

Tentatively identified compounds were not reported by the laboratory.

XIV. System Performance

The system performance was acceptable for samples on which an EPA Level IV review was performed. Raw data were not evaluated for the samples reviewed by EPA Level III criteria.

XV. Overall Assessment of Data

Data flags are summarized at the end of the report if data has been qualified.

XVI. Field Duplicates

Samples MW-M28 and MW-M28-DUP were identified as field duplicates. No volatiles were detected in any of the samples with the following exceptions:

Compound	Concentration (ug/L)		RPD (Limits)
	MW-M28	MW-M28-DUP	
Methyl-tert-butyl ether	0.95	0.93	2 (≤35)

VALIDATION FINDINGS CHECKLIST

Reviewer: BR
2nd Reviewer: [signature]

Method: Volatiles (EPA SW 846 Method 8260B)

Validation Area	Yes	No	NA	Findings/Comments
I. Technical holding times				
All technical holding times were met.	✓			
Cooler temperature criteria was met.	✓			
II. GC/MS Instrument performance check				
Were the BFB performance results reviewed and found to be within the specified criteria?	✓			
Were all samples analyzed within the 12 hour clock criteria?	✓			
III. Initial calibration				
Did the laboratory perform a 5 point calibration prior to sample analysis?	✓	✓		
Were all percent relative standard deviations (%RSD) and relative response factors (RRF) within method criteria for all CCCs and SPCCs?			✓	
Was a curve fit used for evaluation?	✓			
Did the initial calibration meet the curve fit acceptance criteria of ≥ 0.990?	✓			
Were all percent relative standard deviations (%RSD) ≤ 30%/15% and relative response factors (RRF) ≥ 0.05?		✓		
IV. Continuing calibration				
Was a continuing calibration standard analyzed at least once every 12 hours for each instrument?	✓			
Were all percent differences (%D) and relative response factors (RRF) within method criteria for all CCCs and SPCCs?	✓			
Were all percent differences (%D) ≤ 20% and relative response factors (RRF) ≥ 0.05?		✓		
V. Blanks				
Was a method blank associated with every sample in this SDG?	✓			
Was a method blank analyzed at least once every 12 hours for each matrix and concentration?	✓			
Was there contamination in the method blanks? If yes, please see the Blanks validation completeness worksheet.		✓		
VI. Surrogate spikes				
Were all surrogate %R within QC limits?	✓			
If the percent recovery (%R) for one or more surrogates was out of QC limits, was a reanalysis performed to confirm samples with %R outside of criteria?			✓	
VII. Matrix spike/Matrix spike duplicates				
Were a matrix spike (MS) and matrix spike duplicate (MSD) analyzed for each matrix in this SDG? If no, indicate which matrix does not have an associated MS/MSD. Soil / Water.	✓			
Was a MS/MSD analyzed every 20 samples of each matrix?	✓			
Were the MS/MSD percent recoveries (%R) and the relative percent differences (RPD) within the QC limits?	✓			
VIII. Laboratory control samples				
Was an LCS analyzed for this SDG?	✓			

DC #: 32263B1

VALIDATION FINDINGS CHECKLIST

Reviewer: BR
2nd Reviewer: [illegible]

Validation Area	Yes	No	NA	Findings/Comments
Was an LCS analyzed per analytical batch?	✓			
Were the LCS percent recoveries (%R) and relative percent difference (RPD) within the QC limits?	✓			
IX. Regional Quality Assurance and Quality Control				
Were performance evaluation (PE) samples performed?		✓		
Were the performance evaluation (PE) samples within the acceptance limits?			✓	
X. Internal standards				
Were internal standard area counts within -50% or +100% of the associated calibration standard?	✓			
Were retention times within ± 30 seconds of the associated calibration standard?	✓			
XI. Target compound identification				
Were relative retention times (RRT's) within ± 0.06 RRT units of the standard?	✓			
Did compound spectra meet specified EPA "Functional Guidelines" criteria?	✓			
Were chromatogram peaks verified and accounted for?	✓			
XII. Compound quantitation/RLs				
Were the correct internal standard (IS), quantitation ion and relative response factor (RRF) used to quantitate the compound?	✓			
Were compound quantitation and RLs adjusted to reflect all sample dilutions and dry weight factors applicable to level IV validation?	✓			
XIII. Tentatively identified compounds (TICs)				
Were the major ions (> 10 percent relative intensity) in the reference spectrum evaluated in sample spectrum?			✓	
Were relative intensities of the major ions within ± 20% between the sample and the reference spectra?			✓	
Did the raw data indicate that the laboratory performed a library search for all required peaks in the chromatograms (samples and blanks)?		✓		
XIV. System performance				
System performance was found to be acceptable.	✓			
XV. Overall assessment of data				
Overall assessment of data was found to be acceptable.	✓			
XVI. Field duplicates				
Field duplicate pairs were identified in this SDG.	✓			
Target compounds were detected in the field duplicates.	✓			
XVII. Field blanks				
Field blanks were identified in this SDG.	✓			
Target compounds were detected in the field blanks.		✓

Initial Calibration Calculation Verification

Reviewer: BR
2nd Reviewer:

METHOD: GC/MS VOA (EPA SW 846 Method 8260B)

The Relative Response Factor (RRF), average RRF, and percent relative standard deviation (%RSD) were recalculated for the compounds identified below using the following calculations:

$RRF = (A_x)(C_{is})/(A_{is})(C_x)$

average RRF = sum of the RRFs/number of standards

%RSD = 100 * (S/X)

A_x = Area of Compound

C_x = Concentration of compound,

S= Standard deviation of the RRFs,

A_{is} = Area of associated internal standard

C_{is} = Concentration of internal standard

X = Mean of the RRFs

#	Standard ID	Calibration Date	Compound (IS)	Reported RRF (5 std)	Recalculated RRF (5 std)	Reported Average RRF (Initial)	Recalculated Average RRF (Initial)	Reported %RSD	Recalculated %RSD
1	ICAL MS15	11/11/2014	MTBE (IS1)	0.7926	0.7926	0.7743	0.7743	14.2	14.2

2nd Reviewer:

METHOD: GC/MS VOA (EPA SW 846 Method 8260B)

The percent difference (%D) of the initial calibration average Relative Response Factors (RRFs) and the continuing calibration RRFs were recalculated for the compounds identified below using the following calculation:

% Difference = 100 * (ave. RRF - RRF)/ave. RRF
RRF = (Ax)(Cis)/(Ais)(Cx)

Where:
ave. RRF = initial calibration average RRF
RRF = continuing calibration RRF
Ax = Area of compound,
Cx = Concentration of compound,
Ais = Area of associated internal standard
Cis = Concentration of internal standard

#	Standard ID	Calibration Date	Compound (IS)	Average RRF (Initial)	Reported RRF (CC)	Recalculated RRF (CC)	Reported % D	Recalculated %D

**Indicates sample underwent EPA Level IV review

Introduction

This data review covers 9 water samples listed on the cover sheet including dilutions and reanalysis as applicable. The analyses were per EPA Method 200.8 for Dissolved Iron.

This review follows a modified outline of the USEPA Contract Laboratory Program National Functional Guidelines for Inorganic Superfund Data Review (January 2010).

A qualification summary table is provided at the end of this report if data has been qualified. Flags are classified as P (protocol) or A (advisory) to indicate whether the flag is due to a laboratory deviation from a specified protocol or is of technical advisory nature.

Samples indicated by a double asterisk on the front cover underwent an EPA Level IV review. An EPA Level III review was performed on all of the other samples. Raw data were not evaluated for the samples reviewed by EPA Level III criteria since this review is based on QC data.

The following are definitions of the data qualifiers:

U Indicates the compound or analyte was analyzed for but not detected.

J Indicates an estimated value.

R Quality control indicates the data is not usable.

NJ Presumptive evidence of presence of the compound at an estimated quantity.

UJ Indicates the compound or analyte was analyzed for but not detected. The sample detection limit is an estimated value.

A Indicates the finding is based upon technical validation criteria.

P Indicates the finding is related to a protocol/contractual deviation.

None Indicates the data was not significantly impacted by the finding, therefore qualification was not required.

I. Technical Holding Times

All technical holding time requirements were met.

The chain-of-custodies were reviewed for documentation of cooler temperatures. All cooler temperatures met validation criteria.

II. ICPMS Tune

The mass calibration was within 0.1 AMU and the percent relative standard deviation (%RSD) was less than or equal to 5%.

III. Calibration

An initial calibration was performed.

The frequency and analysis criteria of the initial calibration verification (ICV) and continuing calibration verification (CCV) were met.

IV. Blanks

Method blanks were reviewed for each matrix as applicable. No dissolved iron was found in the initial, continuing and preparation blanks.

No field blanks were identified in this SDG.

V. ICP Interference Check Sample (ICS) Analysis

The frequency of analysis was met.

The criteria for analysis were met.

VI. Matrix Spike Analysis

Matrix spike (MS) and matrix spike duplicate (MSD) samples were reviewed for each matrix as applicable. Percent recoveries (%R) and relative percent differences (RPD) were within QC limits.

VII. Duplicate Sample Analysis

The laboratory has indicated that there were no duplicate (DUP) analyses specified for the samples in this SDG, and therefore duplicate analyses were not performed for this SDG.

VIII. Laboratory Control Samples (LCS)

Laboratory control samples were reviewed for each matrix as applicable. Percent recoveries (%R) were within QC limits.

IX. Internal Standards (ICP-MS)

All internal standard percent recoveries (%R) were within QC limits for samples on which an EPA Level IV review was performed. Raw data were not evaluated for the samples reviewed by EPA Level III criteria.

X. ICP Serial Dilution

ICP serial dilution was not performed for this SDG.

XI. Sample Result Verification

All sample result verifications were acceptable for samples on which an EPA Level IV review was performed. Raw data were not evaluated for the samples reviewed by EPA Level III criteria.

XII. Overall Assessment of Data

Data flags are summarized at the end of this report if data has been qualified.

XIII. Field Duplicates

Samples MW-M28 and MW-M28-DUP were identified as field duplicates. No dissolved iron was detected in any of the samples.

VALIDATION FINDINGS CHECKLIST

Reviewer: JO
2nd Reviewer: AC

Method: Metals (EPA SW 846 Method 6010B/7000/6020)

Validation Area	Yes	No	NA	Findings/Comments
I. Technical holding times				
All technical holding times were met.	✓			
Cooler temperature criteria was met.	✓			
II. ICP/MS Tune				
Were all isotopes in the tuning solution mass resolution within 0.1 amu?	✓			
Were %RSD of isotopes in the tuning solution ≤5%?	✓			
III. Calibration				
Were all instruments calibrated daily, each set-up time?	✓			
Were the proper number of standards used?	✓			
Were all initial and continuing calibration verification %Rs within the 90-110% (80-120% for mercury) QC limits?	✓			
Were all initial calibration correlation coefficients > 0.995?	✓			
IV. Blanks				
Was a method blank associated with every sample in this SDG?	✓			
Was there contamination in the method blanks? If yes, please see the Blanks validation completeness worksheet.		✓		
V. ICP Interference Check Sample				
Were ICP interference check samples performed daily?	✓			
Were the AB solution percent recoveries (%R) with the 80-120% QC limits?	✓			
VI. Matrix spike/Matrix spike duplicates				
Were a matrix spike (MS) and duplicate (DUP) analyzed for each matrix in this SDG? If no, indicate which matrix does not have an associated MS/MSD or MS/DUP. Soil / Water.	✓			
Were the MS/MSD percent recoveries (%R) and the relative percent differences (RPD) within the 75-125 QC limits? If the sample concentration exceeded the spike concentration by a factor of 4 or more, no action was taken.	✓			
Were the MS/MSD or duplicate relative percent differences (RPD) ≤ 20% for waters and ≤ 35% for soil samples? A control limit of +/- RL(+/-2X RL for soil) was used for samples that were ≤ 5X the RL, including when only one of the duplicate sample values were ≤ 5X the RL.	✓			
VII. Laboratory control samples				
Was an LCS anaylzed for this SDG?	✓			
Was an LCS analyzed per extraction batch?	✓			
Were the LCS percent recoveries (%R) and relative percent difference (RPD) within the 80-120% QC limits for water samples and laboratory established QC limits for soils?	✓			

Validation Area	Yes	No	NA	Findings/Comments
VIII. Internal Standards (EPA SW 846 Method 6020/EPA 200.8)				
Were all the percent recoveries (%R) within the 30-120% (6020)/60-125% (200.8) of the intensity of the internal standard in the associated initial calibration?	✓			
If the %Rs were outside the criteria, was a reanalysis performed?	✓			
IX. ICP Serial Dilution				
Was an ICP serial dilution analyzed if analyte concentrations were > 50X the MDL (ICP)/>100X the MDL(ICP/MS)?			✓	
Were all percent differences (%Ds) < 10%?			✓	
Was there evidence of negative interference? If yes, professional judgement will be used to qualify the data.			✓	
X. Sample Result Verification				
Were RLs adjusted to reflect all sample dilutions and dry weight factors applicable to level IV validation?	✓			
XI. Overall assessment of data				
Overall assessment of data was found to be acceptable.	✓			
XII. Field duplicates				
Field duplicate pairs were identified in this SDG.	✓			
Target analytes were detected in the field duplicates.		✓		
XIII. Field blanks				
Field blanks were identified in this SDG.		✓		
Target analytes were detected in the field blanks.			✓

Initial and Continuing Calibration Calculation Verification

Page: 1 of 1
Reviewer: JD
2nd Reviewer: 9

METHOD: Trace Metals (EPA SW 846 Method 6010/6020/7000)

An initial and continuing calibration verification percent recovery (%R) was recalculated for each type of analysis using the following formula:

%R = Found x 100 / True

Where, Found = concentration (in ug/L) of each analyte measured in the analysis of the ICV or CCV solution
True = concentration (in ug/L) of each analyte in the ICV or CCV source

Standard ID	Type of Analysis	Element	Found (ug/L)	True (ug/L)	Recalculated %R	Reported %R	Acceptable (Y/N)
	ICP (Initial calibration)

VALIDATION FINDINGS WORKSHEET
Level IV Recalculation Worksheet

Reviewer: SD
2nd Reviewer: 9

METHOD: Trace Metals (EPA SW 846 Method 6010/6020/7000)

Percent recoveries (%R) for an ICP interference check sample, a laboratory control sample and a matrix spike sample were recalculated using the following formula:

$\%R = \frac{Found}{True} \times 100$ Where, Found = Concentration of each analyte measured in the analysis of the sample. For the matrix spike calculation, Found = SSR (spiked sample result) - SR (sample result).
True = Concentration of each analyte in the source.

A sample and duplicate relative percent difference (RPD) was recalculated using the following formula:

$RPD = \frac{|S-D|}{(S+D)/2} \times 100$ Where, S = Original sample concentration
D = Duplicate sample concentration

An ICP serial dilution percent difference (%D) was recalculated using the following formula:

$\%D = \frac{|I-SDR|}{I} \times 100$ Where, I = Initial Sample Result (mg/L)
SDR = Serial Dilution Result (mg/L) (Instrument Reading x 5)

Sample ID	Type of Analysis	Element	Found / S / I (units)	True / D / SDR (units)	Recalculated %R / RPD / %D	Reported %R / RPD / %D	Acceptable (Y/N)

**Indicates sample underwent EPA Level IV review

Introduction

This data review covers 9 water samples listed on the cover sheet including dilutions and reanalysis as applicable. The analyses were per EPA Method 300.0 for Nitrate as Nitrogen and Sulfate.

This review follows a modified outline of the USEPA Contract Laboratory Program National Functional Guidelines for Inorganic Superfund Data Review (January 2010).

A qualification summary table is provided at the end of this report if data has been qualified. Flags are classified as P (protocol) or A (advisory) to indicate whether the flag is due to a laboratory deviation from a specified protocol or is of technical advisory nature.

Samples indicated by a double asterisk on the front cover underwent an EPA Level IV review. An EPA Level III review was performed on all of the other samples. Raw data were not evaluated for the samples reviewed by EPA Level III criteria since this review is based on QC data.

The following are definitions of the data qualifiers:

U Indicates the compound or analyte was analyzed for but not detected.

J Indicates an estimated value.

R Quality control indicates the data is not usable.

NJ Presumptive evidence of presence of the compound at an estimated quantity.

UJ Indicates the compound or analyte was analyzed for but not detected. The sample detection limit is an estimated value.

A Indicates the finding is based upon technical validation criteria.

P Indicates the finding is related to a protocol/contractual deviation.

None Indicates the data was not significantly impacted by the finding, therefore qualification was not required.

I. Technical Holding Times

All technical holding time requirements were met.

The chain-of-custodies were reviewed for documentation of cooler temperatures. All cooler temperatures met validation criteria.

II. Initial Calibration

All criteria for the initial calibration were met.

III. Continuing Calibration

Continuing calibration frequency and analysis criteria were met.

IV. Blanks

Method blanks were reviewed for each matrix as applicable. No contaminant concentrations were found in the initial, continuing and preparation blanks.

No field blanks were identified in this SDG.

V. Matrix Spike/Matrix Spike Duplicates

The laboratory has indicated that there were no matrix spike (MS) and matrix spike duplicate (MSD) analyses specified for the samples in this SDG, and therefore matrix spike and matrix spike duplicate analyses were not performed for this SDG.

VI. Duplicates

The laboratory has indicated that there were no duplicate (DUP) analyses specified for the samples in this SDG, and therefore duplicate analyses were not performed for this SDG.

VII. Laboratory Control Samples

Laboratory control samples were reviewed for each matrix as applicable. Percent recoveries (%R) were within QC limits.

VIII. Sample Result Verification

All sample result verifications were acceptable for samples on which an EPA Level IV review was performed. Raw data were not evaluated for the samples reviewed by EPA Level III criteria.

IX. Overall Assessment of Data

Data flags are summarized at the end of this report if data has been qualified.

X. Field Duplicates

Samples MW-M28 and MW-M28-DUP were identified as field duplicates. No contaminant concentrations were detected in any of the samples with the following exceptions:

Analyte	Concentration (mg/L)		RPD (Limits)
	MW-M28	MW-M28-DUP	
Sulfate	55	55	0 (≤35)

VALIDATION FINDINGS CHECKLIST

Reviewer: SB
2nd Reviewer: DL

Method: Inorganics (EPA Method See Cover)

Validation Area	Yes	No	NA	Findings/Comments
I. Technical holding times				
All technical holding times were met.	✓			
Cooler temperature criteria was met.	✓			
II. Calibration				
Were all instruments calibrated daily, each set-up time?	✓			
Were the proper number of standards used?	✓			
Were all initial calibration correlation coefficients ≥ 0.995?	✓			
Were all initial and continuing calibration verification %Rs within the 90-110% QC limits?	✓			
Were titrant checks performed as required? (Level IV only)			✓	
Were balance checks performed as required? (Level IV only)			✓	
III. Blanks				
Was a method blank associated with every sample in this SDG?	✓			
Was there contamination in the method blanks? If yes, please see the Blanks validation completeness worksheet.		✓		
IV. Matrix spike/Matrix spike duplicates and Duplicates				
Were a matrix spike (MS) and duplicate (DUP) analyzed for each matrix in this SDG? If no, indicate which matrix does not have an associated MS/MSD or MS/DUP. Soil / Water.			✓	
Were the MS/MSD percent recoveries (%R) and the relative percent differences (RPD) within the 75-125 QC limits? If the sample concentration exceeded the spike concentration by a factor of 4 or more, no action was taken.			✓	
Were the MS/MSD or duplicate relative percent differences (RPD) ≤ 20% for waters and ≤ 35% for soil samples? A control limit of ≤ CRDL(≤ 2X CRDL for soil) was used for samples that were ≤ 5X the CRDL, including when only one of the duplicate sample values were ≤ 5X the CRDL.			✓	
V. Laboratory control samples				
Was an LCS anaylzed for this SDG?	✓			
Was an LCS analyzed per extraction batch?	✓			
Were the LCS percent recoveries (%R) and relative percent difference (RPD) within the 80-120% (85-115% for Method 300.0) QC limits?	✓			
VI. Regional Quality Assurance and Quality Control				
Were performance evaluation (PE) samples performed?			✓	
Were the performance evaluation (PE) samples within the acceptance limits?			✓

Method: Inorganics, Method See Cover

The correlation coefficient (r) for the calibration of NO_3-N was recalculated. Calibration date: 7/23/14

An initial or continuing calibration verification percent recovery (%R) was recalculated for each type of analysis using the following formula:

%R = Found X 100 / True

Where, Found = concentration of each analyte measured in the analysis of the ICV or CCV solution
True = concentration of each analyte in the ICV or CCV source

Type of analysis	Analyte	Standard	Conc. (mg/L)	Area	Recalculated r or r^2	Reported r or r^2	Acceptable (Y/N)
Initial Calibration Verification	NO_3-N	0	0.125	0.018	0.999972	0.999186	Y
		s1	0.25	0.033			
		s2	0.5	0.084

METHOD: Inorganics, Method See Cover

Percent recoveries (%R) for a laboratory control sample and a matrix spike sample were recalculated using the following formula:

%R = Found x 100 / True Where, Found = concentration of each analyte measured in the analysis of the sample. For the matrix spike calculation, Found = SSR (spiked sample result) - SR (sample result).
True = concentration of each analyte in the source.

A sample and duplicate relative percent difference (RPD) was recalculated using the following formula:

RPD = |S-D| x 100 / (S+D)/2 Where, S = Original sample concentration
D = Duplicate sample concentration

Sample ID	Type of Analysis	Element	Found / S (units)	True / D (units)	Recalculated %R / RPD	Reported %R / RPD	Acceptable (Y/N)
LCS 11:22	Laboratory control sample	NO_3-N	5.57 mg/L	5 mg/L	111%R	111%R	Y
N	Matrix spike sample		(SSR-SR)

Please see qualifications below for all questions answered "N". Not applicable questions are identified as "N/A".

Y N N/A Have results been reported and calculated correctly?
Y N N/A Are results within the calibrated range of the instruments?
Y N N/A Are all detection limits below the CRQL?

Compound (analyte) results for (1) SO4 reported with a positive detect were recalculated and verified using the following equation:

Concentration = $\frac{\sqrt{4a(Area - c) + b^2} - b}{2a}$

Recalculation: $\frac{\sqrt{4(1.43E-04)(4.47378 - (-0.011)) + (5.49E-02)^2} - 5.49E-02}{2(1.43E-04)} =$

Area = 4.47378

a = 1.43E-04 b = 5.49E-02 C = -0.011

**Indicates sample underwent EPA Level IV review

Introduction

This data review covers 21 water samples listed on the cover sheet including dilutions and reanalysis as applicable. The analyses were per EPA SW 846 Method 8260B for Volatiles (Short List).

This review follows a modified outline of the USEPA Contract Laboratory Program National Functional Guidelines for Inorganic Superfund Data Review (January 2010).

A qualification summary table is provided at the end of this report if data has been qualified. Flags are classified as P (protocol) or A (advisory) to indicate whether the flag is due to a laboratory deviation from a specified protocol or is of technical advisory nature.

Samples indicated by a double asterisk on the front cover underwent an EPA Level IV review. An EPA Level III review was performed on all of the other samples. Raw data were not evaluated for the samples reviewed by EPA Level III criteria since this review is based on QC data.

The following are definitions of the data qualifiers:

U Indicates the compound or analyte was analyzed for but not detected.

J Indicates an estimated value.

R Quality control indicates the data is not usable.

NJ Presumptive evidence of presence of the compound at an estimated quantity.

UJ Indicates the compound or analyte was analyzed for but not detected. The sample detection limit is an estimated value.

A Indicates the finding is based upon technical validation criteria.

P Indicates the finding is related to a protocol/contractual deviation.

None Indicates the data was not significantly impacted by the finding, therefore qualification was not required.

I. Technical Holding Times

All technical holding time requirements were met.

The chain-of-custodies were reviewed for documentation of cooler temperatures. All cooler temperatures met validation criteria.

II. GC/MS Instrument Performance Check

Instrument performance was checked at 12 hour intervals.

All ion abundance requirements were met.

III. Initial Calibration

Initial calibration was performed using required standard concentrations with the following exceptions:

Sample	Compound	Finding	Criteria	Flag	A or P
957-MW4** PG-MW1 LEA-MW5 IT-GMP-15 IT-GMP-17 IT-PZ-9 IT-GMP-18 IT-GMP-18-DUP MW-M9 MBLKMS15W1125A	tert-Butyl formate	A one point calibration was performed.	A five point calibration is specified by the method.	J (all detects) UJ (all non-detects)	P

Percent relative standard deviations (%RSD) were less than or equal to 15.0% for all compounds.

In the case where the laboratory used a calibration curve to evaluate the compounds, all coefficients of determination (r^2) were greater than or equal to 0.990.

Average relative response factors (RRF) for all compounds were within method and validation criteria with the following exceptions:

Date	Compound	RRF (Limits)	Associated Samples	Flag	A or P
11/11/14	tert-Butyl alcohol	0.01302 (≥0.05)	957-MW4** PG-MW1 LEA-MW5 IT-GMP-15 IT-GMP-17 IT-PZ-9 IT-GMP-18 IT-GMP-18-DUP MW-M9 MBLKMS15W1125A	J (all detects) UJ (all non-detects)	A

IV. Continuing Calibration

Continuing calibration was performed at the required frequencies.

Percent differences (%D) between the initial calibration RRF and the continuing calibration RRF were within the method criteria of less than or equal to 20.0% for all compounds with the following exceptions:

Date	Compound	%D	Associated Samples	Flag	A or P
11/25/14	tert-Butyl alcohol	24.9	957-MW4** PG-MW1 LEA-MW5 IT-GMP-15 IT-GMP-17 IT-PZ-9 IT-GMP-18 IT-GMP-18-DUP MW-M9 MBLKMS15W1125A	J (all detects) UJ (all non-detects)	A

The percent differences (%D) of the second source calibration standard were less than or equal to 20.0% for all compounds.

All of the continuing calibration relative response factors (RRF) were within method and validation criteria with the following exceptions:

Date	Compound	RRF (Limits)	Associated Samples	Flag	A or P
11/25/14	tert-Butyl alcohol	0.016 (≥0.05)	957-MW4** PG-MW1 LEA-MW5 IT-GMP-15 IT-GMP-17 IT-PZ-9 IT-GMP-18 IT-GMP-18-DUP MW-M9 MBLKMS15W1125A	J (all detects) UJ (all non-detects)	A

V. Blanks

Method blanks were reviewed for each matrix as applicable. No volatile contaminants were found in the method blanks.

Sample 11132014-EB was identified as an equipment blank. No volatile contaminants were found.

Sample 11132014-FB was identified as a field blank. No volatile contaminants were found.

VI. Surrogate Spikes

Surrogates were added to all samples and blanks as required by the method. All surrogate recoveries (%R) were within QC limits.

VII. Matrix Spike/Matrix Spike Duplicates

Matrix spike (MS) and matrix spike duplicate (MSD) samples were reviewed for each matrix as applicable. Percent recoveries (%R) and relative percent differences (RPD) were within QC limits.

VIII. Laboratory Control Samples (LCS)

Laboratory control samples were reviewed for each matrix as applicable. Percent recoveries (%R) were within QC limits.

IX. Regional Quality Assurance and Quality Control

Not applicable.

X. Internal Standards

All internal standard areas and retention times were within QC limits.

XI. Target Compound Identifications

All target compound identifications were within validation criteria for samples on which an EPA Level IV review was performed. Raw data were not evaluated for the samples reviewed by EPA Level III criteria.

XII. Compound Quantitation

All compound quantitation were within validation criteria on which an EPA Level IV review was performed. Raw data were not evaluated for the samples reviewed by EPA Level III criteria.

XIII. Tentatively Identified Compounds (TICs)

Tentatively identified compounds were not reported by the laboratory.

XIV. System Performance

The system performance was acceptable for samples on which an EPA Level IV review was performed. Raw data were not evaluated for the samples reviewed by EPA Level III criteria.

XV. Overall Assessment of Data

Data flags are summarized at the end of the report if data has been qualified.

XVI. Field Duplicates

Samples 970-MW3 and 970-MW3-DUP and samples IT-GMP-18 and IT-GMP-18-DUP were identified as field duplicates. No volatiles were detected in any of the samples with the following exceptions:

Compound	Concentration (ug/L)		RPD (Limits)
	IT-GMP-18	IT-GMP-18-DUP	
tert-Butyl alcohol	24	23	4 (≤35)
Methyl-tert-butyl ether	190	190	0 (≤35)

Data flags are DOD specified with criteria that may differ from EPA or inhouse statistical criteria.
Information regarding the estimate of the uncertainty of measurement is available upon client request.
Q = One or more quality control criteria failed.
T = Tertiary butyl formate (TBF) is unstable in samples and standards. Measured concentrations and reporting limits should be considered estimates.

ND = Not Detected

Laboratory: Alpha Analytical, Inc. Reviewer: BF
2nd Reviewer: [illegible]

METHOD: GC/MS Volatiles (Short List) (EPA SW846 Method 8260B)

The samples listed below were reviewed for each of the following validation areas. Validation findings are noted in attached validation findings worksheets.

	Validation Area		Comments
I.	Technical holding times	A	Sampling dates: 11/13/14
II.	GC/MS Instrument performance check	A	
III.	Initial calibration	SW	RSD ≤ 15%, r²
IV.	Continuing calibration/ICV	SW	|CV| CCV ≤ 20%
V.	Blanks	A	
VI.	Surrogate spikes	A	
VII.	Matrix spike/Matrix spike duplicates	A	
VIII.	Laboratory control samples	A	LCS
IX.	Regional Quality Assurance and Quality Control	N	
X.	Internal standards	A	
XI.	Target compound identification	A	Not reviewed for Level III validation.
XII.	Compound quantitation/RL/LOQ/LODs	A	Not reviewed for Level III validation.
XIII.	Tentitatively identified compounds (TICs)	N	Not reviewed for Level III validation.
XIV.	System performance	A	Not reviewed for Level III validation.
XV.	Overall assessment of data	A	
XVI.	Field duplicates	SW	FD = 6 + 7, 14 + 15
XVII.	Field blanks	ND	FB = 16 EB = 17

Note: A = Acceptable; N = Not provided/applicable; SW = See worksheet; ND = No compounds detected; R = Rinsate; FB = Field blank; D = Duplicate; TB = Trip blank; EB = Equipment blank

Validated Samples: ** Indicates sample underwent Level IV validation

VALIDATION FINDINGS CHECKLIST

Reviewer: BR
2nd Reviewer: [illegible]

Method: Volatiles (EPA SW 846 Method 8260B)

Validation Area	Yes	No	NA	Findings/Comments
I. Technical holding times				
All technical holding times were met.	✓			
Cooler temperature criteria was met.	✓			
II. GC/MS instrument performance check				
Were the BFB performance results reviewed and found to be within the specified criteria?	✓			
Were all samples analyzed within the 12 hour clock criteria?	✓			
III. Initial calibration				
Did the laboratory perform a 5 point calibration prior to sample analysis?	✓			
Were all percent relative standard deviations (%RSD) and relative response factors (RRF) within method criteria for all CCCs and SPCCs?	✓			
Was a curve fit used for evaluation?	✓			
Did the initial calibration meet the curve fit acceptance criteria of ≥ 0.990?	✓			
Were all percent relative standard deviations (%RSD) ≤ 30%/15% and relative response factors (RRF) > 0.05?		✓		
IV. Continuing calibration				
Was a continuing calibration standard analyzed at least once every 12 hours for each instrument?	✓			
Were all percent differences (%D) and relative response factors (RRF) within method criteria for all CCCs and SPCCs?	✓			
Were all percent differences (%D) ≤ 20% and relative response factors (RRF) ≥ 0.05?		✓		
V. Blanks				
Was a method blank associated with every sample in this SDG?	✓			
Was a method blank analyzed at least once every 12 hours for each matrix and concentration?	✓			
Was there contamination in the method blanks? If yes, please see the Blanks validation completeness worksheet.		✓		
VI. Surrogate spikes				
Were all surrogate %R within QC limits?	✓			
If the percent recovery (%R) for one or more surrogates was out of QC limits, was a reanalysis performed to confirm samples with %R outside of criteria?			✓	
VII. Matrix spike/Matrix spike duplicates				
Were a matrix spike (MS) and matrix spike duplicate (MSD) analyzed for each matrix in this SDG? If no, indicate which matrix does not have an associated MS/MSD. Soil / Water.	✓			
Was a MS/MSD analyzed every 20 samples of each matrix?	✓			
Were the MS/MSD percent recoveries (%R) and the relative percent differences (RPD) within the QC limits?	✓			
VIII. Laboratory control samples				
Was an LCS analyzed for this SDG?	✓			

LDC #: 33263C1

VALIDATION FINDINGS CHECKLIST

Reviewer: BR
2nd Reviewer:

Validation Area	Yes	No	NA	Findings/Comments
Was an LCS analyzed per analytical batch?	✓			
Were the LCS percent recoveries (%R) and relative percent difference (RPD) within the QC limits?	✓			
IX. Regional Quality Assurance and Quality Control				
Were performance evaluation (PE) samples performed?		✓		
Were the performance evaluation (PE) samples within the acceptance limits?			✓	
X. Internal standards				
Were internal standard area counts within -50% or +100% of the associated calibration standard?	✓			
Were retention times within ± 30 seconds of the associated calibration standard?	✓			
XI. Target compound identification				
Were relative retention times (RRT's) within ± 0.06 RRT units of the standard?	✓			
Did compound spectra meet specified EPA "Functional Guidelines" criteria?	✓			
Were chromatogram peaks verified and accounted for?	✓			
XII. Compound quantitation/RLs				
Were the correct internal standard (IS), quantitation ion and relative response factor (RRF) used to quantitate the compound?	✓			
Were compound quantitation and RLs adjusted to reflect all sample dilutions and dry weight factors applicable to level IV validation?	✓			
XIII. Tentatively identified compounds (TICs)				
Were the major ions (> 10 percent relative intensity) in the reference spectrum evaluated in sample spectrum?			✓	
Were relative intensities of the major ions within ± 20% between the sample and the reference spectra?			✓	
Did the raw data indicate that the laboratory performed a library search for all required peaks in the chromatograms (samples and blanks)?		✓		
XIV. System performance				
System performance was found to be acceptable.	✓			
XV. Overall assessment of data				
Overall assessment of data was found to be acceptable.	✓			
XVI. Field duplicates				
Field duplicate pairs were identified in this SDG.	✓			
Target compounds were detected in the field duplicates.	✓			
XVII. Field blanks				
Field blanks were identified in this SDG.	✓			
Target compounds were detected in the field blanks.		✓

The Relative Response Factor (RRF), average RRF, and percent relative standard deviation (%RSD) were recalculated for the compounds identified below using the following calculations:

$RRF = (A_x)(C_{is})/(A_{is})(C_x)$

average RRF = sum of the RRFs/number of standards

%RSD = 100 * (S/X)

A_x = Area of Compound

C_x = Concentration of compound,

S= Standard deviation of the RRFs,

A_{is} = Area of associated internal standard

C_{is} = Concentration of internal standard

X = Mean of the RRFs

#	Standard ID	Calibration Date	Compound (IS)	Reported RRF (5 std)	Recalculated RRF (5 std)	Reported Average RRF (Initial)	Recalculated Average RRF (Initial)	Reported %RSD	Recalculated %RSD

MW-M9

**Indicates sample underwent EPA Level IV review

Introduction

This data review covers 9 water samples listed on the cover sheet including dilutions and reanalysis as applicable. The analyses were per EPA Method 200.8 for Dissolved Iron.

This review follows a modified outline of the USEPA Contract Laboratory Program National Functional Guidelines for Inorganic Superfund Data Review (January 2010).

A qualification summary table is provided at the end of this report if data has been qualified. Flags are classified as P (protocol) or A (advisory) to indicate whether the flag is due to a laboratory deviation from a specified protocol or is of technical advisory nature.

Samples indicated by a double asterisk on the front cover underwent an EPA Level IV review. An EPA Level III review was performed on all of the other samples. Raw data were not evaluated for the samples reviewed by EPA Level III criteria since this review is based on QC data.

The following are definitions of the data qualifiers:

U Indicates the compound or analyte was analyzed for but not detected.

J Indicates an estimated value.

R Quality control indicates the data is not usable.

NJ Presumptive evidence of presence of the compound at an estimated quantity.

UJ Indicates the compound or analyte was analyzed for but not detected. The sample detection limit is an estimated value.

A Indicates the finding is based upon technical validation criteria.

P Indicates the finding is related to a protocol/contractual deviation.

None Indicates the data was not significantly impacted by the finding, therefore qualification was not required.

I. Technical Holding Times

All technical holding time requirements were met.

The chain-of-custodies were reviewed for documentation of cooler temperatures. All cooler temperatures met validation criteria.

II. ICPMS Tune

The mass calibration was within 0.1 AMU and the percent relative standard deviation (%RSD) was less than or equal to 5%.

III. Calibration

An initial calibration was performed.

The frequency and analysis criteria of the initial calibration verification (ICV) and continuing calibration verification (CCV) were met.

IV. Blanks

Method blanks were reviewed for each matrix as applicable. No dissolved iron was found in the initial, continuing and preparation blanks.

No field blanks were identified in this SDG.

V. ICP Interference Check Sample (ICS) Analysis

The frequency of analysis was met.

The criteria for analysis were met.

VI. Matrix Spike Analysis

The laboratory has indicated that there were no matrix spike (MS) and matrix spike duplicate (MSD) analyses specified for the samples in this SDG, and therefore matrix spike and matrix spike duplicate analyses were not performed for this SDG.

VII. Duplicate Sample Analysis

The laboratory has indicated that there were no duplicate (DUP) analyses specified for the samples in this SDG, and therefore duplicate analyses were not performed for this SDG.

VIII. Laboratory Control Samples (LCS)

Laboratory control samples were reviewed for each matrix as applicable. Percent recoveries (%R) were within QC limits.

IX. Internal Standards (ICP-MS)

All internal standard percent recoveries (%R) were within QC limits for samples on which an EPA Level IV review was performed. Raw data were not evaluated for the samples reviewed by EPA Level III criteria.

X. ICP Serial Dilution

ICP serial dilution was not performed for this SDG.

XI. Sample Result Verification

All sample result verifications were acceptable for samples on which an EPA Level IV review was performed. Raw data were not evaluated for the samples reviewed by EPA Level III criteria.

XII. Overall Assessment of Data

Data flags are summarized at the end of this report if data has been qualified.

XIII. Field Duplicates

Samples IT-GMP-18 and IT-GMP-18-DUP were identified as field duplicates. No dissolved iron was detected in any of the samples.

METHOD: Trace Metals (EPA SW 846 Method 6010/6020/7000)

Percent recoveries (%R) for an ICP interference check sample, a laboratory control sample and a matrix spike sample were recalculated using the following formula:

%R = Found x 100 / True

Where, Found = Concentration of each analyte measured in the analysis of the sample. For the matrix spike calculation, Found = SSR (spiked sample result) - SR (sample result).
True = Concentration of each analyte in the source.

A sample and duplicate relative percent difference (RPD) was recalculated using the following formula:

RPD = |S-D| x 100 / (S+D)/2

Where, S = Original sample concentration
D = Duplicate sample concentration

An ICP serial dilution percent difference (%D) was recalculated using the following formula:

%D = |I-SDR| x 100 / I

Where, I = Initial Sample Result (mg/L)
SDR = Serial Dilution Result (mg/L) (Instrument Reading x 5)

Sample ID	Type of Analysis	Element	Found / S / I (units)	True / D / SDR (units)	Recalculated %R / RPD / %D	Reported %R / RPD / %D	Acceptable (Y/N)

**Indicates sample underwent EPA Level IV review

Introduction

This data review covers 11 water samples listed on the cover sheet including dilutions and reanalysis as applicable. The analyses were per EPA Method 300.0 for Nitrate as Nitrogen and Sulfate.

This review follows a modified outline of the USEPA Contract Laboratory Program National Functional Guidelines for Inorganic Superfund Data Review (January 2010).

A qualification summary table is provided at the end of this report if data has been qualified. Flags are classified as P (protocol) or A (advisory) to indicate whether the flag is due to a laboratory deviation from a specified protocol or is of technical advisory nature.

Samples indicated by a double asterisk on the front cover underwent an EPA Level IV review. An EPA Level III review was performed on all of the other samples. Raw data were not evaluated for the samples reviewed by EPA Level III criteria since this review is based on QC data.

The following are definitions of the data qualifiers:

U Indicates the compound or analyte was analyzed for but not detected.

J Indicates an estimated value.

R Quality control indicates the data is not usable.

NJ Presumptive evidence of presence of the compound at an estimated quantity.

UJ Indicates the compound or analyte was analyzed for but not detected. The sample detection limit is an estimated value.

A Indicates the finding is based upon technical validation criteria.

P Indicates the finding is related to a protocol/contractual deviation.

None Indicates the data was not significantly impacted by the finding, therefore qualification was not required.

I. Technical Holding Times

All technical holding time requirements were met.

The chain-of-custodies were reviewed for documentation of cooler temperatures. All cooler temperatures met validation criteria.

II. Initial Calibration

All criteria for the initial calibration were met.

III. Continuing Calibration

Continuing calibration frequency and analysis criteria were met.

IV. Blanks

Method blanks were reviewed for each matrix as applicable. No contaminant concentrations were found in the initial, continuing and preparation blanks.

No field blanks were identified in this SDG.

V. Matrix Spike/Matrix Spike Duplicates

Matrix spike (MS) and matrix spike duplicate (MSD) analyses were reviewed for each matrix as applicable. Percent recoveries (%R) and relative percent differences (RPD) were within QC limits.

VI. Duplicates

The laboratory has indicated that there were no duplicate (DUP) analyses specified for the samples in this SDG, and therefore duplicate analyses were not performed for this SDG.

VII. Laboratory Control Samples

Laboratory control samples were reviewed for each matrix as applicable. Percent recoveries (%R) and relative percent differences (RPD) were within QC limits.

VIII. Sample Result Verification

All sample result verifications were acceptable for samples on which an EPA Level IV review was performed. Raw data were not evaluated for the samples reviewed by EPA Level III criteria.

IX. Overall Assessment of Data

Data flags are summarized at the end of this report if data has been qualified.

X. Field Duplicates

Samples IT-GMP-18 and IT-GMP-18-DUP were identified as field duplicates. No contaminant concentrations were detected in any of the samples with the following exceptions:

Analyte	Concentration (mg/L)		RPD (Limits)
	IT-GMP-18	IT-GMP-18-DUP	
Sulfate	48	47	2 (≤35)

Method: Inorganics (EPA Method See Cover)

Validation Area	Yes	No	NA	Findings/Comments
I. Technical holding times				
All technical holding times were met.	✓			
Cooler temperature criteria was met.	✓			
II. Calibration				
Were all instruments calibrated daily, each set-up time?	✓			
Were the proper number of standards used?	✓			
Were all initial calibration correlation coefficients ≥ 0.995?	✓			
Were all initial and continuing calibration verification %Rs within the 90-110% QC limits?	✓			
Were titrant checks performed as required? (Level IV only)			✓	
Were balance checks performed as required? (Level IV only)			✓	
III. Blanks				
Was a method blank associated with every sample in this SDG?	✓			
Was there contamination in the method blanks? If yes, please see the Blanks validation completeness worksheet.		✓		
IV. Matrix spike/Matrix spike duplicates and Duplicates				
Were a matrix spike (MS) and duplicate (DUP) analyzed for each matrix in this SDG? If no, indicate which matrix does not have an associated MS/MSD or MS/DUP. Soil / Water.	✓			
Were the MS/MSD percent recoveries (%R) and the relative percent differences (RPD) within the 75-125 QC limits? If the sample concentration exceeded the spike concentration by a factor of 4 or more, no action was taken.	✓			
Were the MS/MSD or duplicate relative percent differences (RPD) ≤ 20% for waters and ≤ 35% for soil samples? A control limit of ≤ CRDL(≤ 2X CRDL for soil) was used for samples that were ≤ 5X the CRDL, including when only one of the duplicate sample values were < 5X the CRDL.	✓			
V. Laboratory control samples				
Was an LCS anaylzed for this SDG?	✓			
Was an LCS analyzed per extraction batch?	✓			
Were the LCS percent recoveries (%R) and relative percent difference (RPD) within the 80-120% (85-115% for Method 300.0) QC limits?	✓			
VI. Regional Quality Assurance and Quality Control				
Were performance evaluation (PE) samples performed?			✓	
Were the performance evaluation (PE) samples within the acceptance limits?			✓	

Validation Area	Yes	No	NA	Findings/Comments
VII. Sample Result Verification				
Were RLs adjusted to reflect all sample dilutions and dry weight factors applicable to level IV validation?	✓			
Were detection limits < RL?	✓			
VIII. Overall assessment of data				
Overall assessment of data was found to be acceptable.	✓			
IX. Field duplicates				
Field duplicate pairs were identified in this SDG.	✓			
Target analytes were detected in the field duplicates.	✓			
X. Field blanks				
Field blanks were identified in this SDG.		✓		
Target analytes were detected in the field blanks.			✓

Method: Inorganics, Method See Cover

The correlation coefficient (r) for the calibration of NO3-N was recalculated. Calibration date: 7/23/14

An initial or continuing calibration verification percent recovery (%R) was recalculated for each type of analysis using the following formula:

%R = Found X 100 / True

Where, Found = concentration of each analyte measured in the analysis of the ICV or CCV solution

True = concentration of each analyte in the ICV or CCV source

Type of analysis	Analyte	Standard	Conc. (mg/L)	Area	Recalculated r or r^2	Reported r or r^2	Acceptable (Y/N)
Initial Calibration Verification	NO3-N	0	0.125	0.018	0.999972	0.999186	Y
		s1	0.25	0.033			
		s2	0.5	0.084

METHOD: Inorganics, Method See Cover

Percent recoveries (%R) for a laboratory control sample and a matrix spike sample were recalculated using the following formula:

%R = Found x 100 / True Where, Found = concentration of each analyte measured in the analysis of the sample. For the matrix spike calculation, Found = SSR (spiked sample result) - SR (sample result).
True = concentration of each analyte in the source.

A sample and duplicate relative percent difference (RPD) was recalculated using the following formula:

RPD = |S-D| x 100 / (S+D)/2 Where, S = Original sample concentration
D = Duplicate sample concentration

Sample ID	Type of Analysis	Element	Found / S (units)	True / D (units)	Recalculated %R / RPD	Reported %R / RPD	Acceptable (Y/N)

Introduction

This data review covers 12 water samples listed on the cover sheet including dilutions and reanalysis as applicable. The analyses were per EPA SW 846 Method 8260B for Volatiles (Short List).

This review follows a modified outline of the USEPA Contract Laboratory Program National Functional Guidelines for Superfund Data Review (June 2010).

A qualification summary table is provided at the end of this report if data has been qualified. Flags are classified as P (protocol) or A (advisory) to indicate whether the flag is due to a laboratory deviation from a specified protocol or is of technical advisory nature.

Raw data were not reviewed for this SDG. The review was based on QC data.

The following are definitions of the data qualifiers:

U Indicates the compound or analyte was analyzed for but not detected.

J Indicates an estimated value.

R Quality control indicates the data is not usable.

NJ Presumptive evidence of presence of the compound at an estimated quantity.

UJ Indicates the compound or analyte was analyzed for but not detected. The sample detection limit is an estimated value.

A Indicates the finding is based upon technical validation criteria.

P Indicates the finding is related to a protocol/contractual deviation.

None Indicates the data was not significantly impacted by the finding, therefore qualification was not required.

I. Technical Holding Times

All technical holding time requirements were met.

The chain-of-custodies were reviewed for documentation of cooler temperatures. All cooler temperatures met validation criteria.

II. GC/MS Instrument Performance Check

Instrument performance was checked at 12 hour intervals.

All ion abundance requirements were met.

III. Initial Calibration

Initial calibration was performed using required standard concentrations.

Initial calibration of compounds was performed as required by the method with the following exceptions:

Sample	Compound	Finding	Criteria	Flag	A or P
MW-M15 MWM23 MW-4A 970-MW4 MW-1A MBLKMS15W1126A	tert-Butyl formate	A single point calibration was performed.	A five point calibration is specified by the method.	J (all detects) UJ (all non-detects)	P

Percent relative standard deviations (%RSD) were less than or equal to 15.0% for all compounds.

Average relative response factors (RRF) for all compounds were within method and validation criteria with the following exceptions:

Date	Compound	RRF (Limits)	Associated Samples	Flag	A or P
11/11/14	tert-Butyl alcohol	0.01302 (≥0.05)	MW-M15 MW-M23 MW-4A 970-MW4 MW-1A MBLKMS15W1126A	J (all detects) UJ (all non-detects)	A

IV. Continuing Calibration

Continuing calibration was performed at the required frequencies.

Percent differences (%D) between the initial calibration RRF and the continuing calibration RRF were within the method criteria of less than or equal to 20.0% for all compounds.

The percent differences (%D) of the second source calibration standard were less than or equal to 20.0% for all compounds.

All of the continuing calibration relative response factors (RRF) were within method and validation criteria with the following exceptions:

Date	Compound	RRF (Limits)	Associated Samples	Flag	A or P
11/26/14	tert-Butyl alcohol	0.015 (≥0.05)	MW-M15 MW-M23 MW-4A 970-MW4 MW-1A MBLKMS15W1126A	J (all detects) UJ (all non-detects)	A

V. Blanks

Method blanks were reviewed for each matrix as applicable. No volatile contaminants were found in the method blanks.

Sample 11142014-EB was identified as an equipment blank. No volatile contaminants were found.

Sample 11142014-FB was identified as a field blank. No volatile contaminants were found.

VI. Surrogate Spikes

Surrogates were added to all samples and blanks as required by the method. All surrogate recoveries (%R) were within QC limits.

VII. Matrix Spike/Matrix Spike Duplicates

The laboratory has indicated that there were no matrix spike (MS) and matrix spike duplicate (MSD) analyses specified for the samples in this SDG, and therefore matrix spike and matrix spike duplicate analyses were not performed for this SDG.

VIII. Laboratory Control Samples (LCS)

Laboratory control samples were reviewed for each matrix as applicable. Percent recoveries (%R) were within QC limits.

IX. Regional Quality Assurance and Quality Control

Not applicable.

X. Internal Standards

All internal standard areas and retention times were within QC limits.

XI. Target Compound Identifications

Raw data were not reviewed for this SDG.

XII. Compound Quantitation

Raw data were not reviewed for this SDG.

XIII. Tentatively Identified Compounds (TICs)

Raw data were not reviewed for this SDG.

XIV. System Performance

Raw data were not reviewed for this SDG.

XV. Overall Assessment of Data

Data flags are summarized at the end of this report if data has been qualified.

XVI. Field Duplicates

No field duplicates were identified in this SDG.

Data Validation Report

Project/Site Name: DoDHF Novato, CA

Collection Date: November 14, 2014

LDC Report Date: December 22, 2014

Matrix: Water

Parameters: Dissolved Iron

Validation Level: EPA Level III

Laboratory: Alpha Analytical, Inc.

Sample Delivery Group (SDG): BMI14111760

Sample Identification

MW-M15
MW-M23
MW-4A
970-MW4
MW-1A

Introduction

This data review covers 5 water samples listed on the cover sheet including dilutions and reanalysis as applicable. The analyses were per EPA Method 200.8 for Dissolved Iron.

This review follows a modified outline of the USEPA Contract Laboratory Program National Functional Guidelines for Inorganic Superfund Data Review (January 2010).

A qualification summary table is provided at the end of this report if data has been qualified. Flags are classified as P (protocol) or A (advisory) to indicate whether the flag is due to a laboratory deviation from a specified protocol or is of technical advisory nature.

Raw data were not reviewed for this SDG. The review was based on QC data.

The following are definitions of the data qualifiers:

U Indicates the compound or analyte was analyzed for but not detected.

J Indicates an estimated value.

R Quality control indicates the data is not usable.

NJ Presumptive evidence of presence of the compound at an estimated quantity.

UJ Indicates the compound or analyte was analyzed for but not detected. The sample detection limit is an estimated value.

A Indicates the finding is based upon technical validation criteria.

P Indicates the finding is related to a protocol/contractual deviation.

None Indicates the data was not significantly impacted by the finding, therefore qualification was not required.

I. Technical Holding Times

All technical holding time requirements were met.

The chain-of-custodies were reviewed for documentation of cooler temperatures. All cooler temperatures met validation criteria.

II. ICPMS Tune

The mass calibration was within 0.1 AMU and the percent relative standard deviation (%RSD) was less than or equal to 5%.

III. Calibration

The initial and continuing calibrations were performed at the required frequency.

The calibration standards criteria were met.

IV. Blanks

Method blanks were reviewed for each matrix as applicable. No dissolved iron was found in the initial, continuing and preparation blanks.

No field blanks were identified in this SDG.

V. ICP Interference Check Sample (ICS) Analysis

The frequency of analysis was met.

The criteria for analysis were met.

VI. Matrix Spike Analysis

The laboratory has indicated that there were no matrix spike (MS) and matrix spike duplicate (MSD) analyses specified for the samples in this SDG, and therefore matrix spike and matrix spike duplicate analyses were not performed for this SDG.

VII. Duplicate Sample Analysis

The laboratory has indicated that there were no duplicate (DUP) analyses specified for the samples in this SDG, and therefore duplicate analyses were not performed for this SDG.

VIII. Laboratory Control Samples (LCS)

Laboratory control samples were reviewed for each matrix as applicable. Percent recoveries (%R) were within QC limits.

IX. Internal Standards (ICP-MS)

Internal standards data were not reviewed for Level III.

X. ICP Serial Dilution

ICP serial dilution was not performed for this SDG.

XI. Sample Result Verification

Raw data were not reviewed for this SDG.

XII. Overall Assessment of Data

Data flags are summarized at the end of this report if data has been qualified.

XIII. Field Duplicates

No field duplicates were identified in this SDG.

Introduction

This data review covers 7 water samples listed on the cover sheet including dilutions and reanalysis as applicable. The analyses were per EPA Method 300.0 for Nitrate as Nitrogen and Sulfate.

This review follows a modified outline of the USEPA Contract Laboratory Program National Functional Guidelines for Inorganic Superfund Data Review (January 2010).

A qualification summary table is provided at the end of this report if data has been qualified. Flags are classified as P (protocol) or A (advisory) to indicate whether the flag is due to a laboratory deviation from a specified protocol or is of technical advisory nature.

Raw data were not reviewed for this SDG. The review was based on QC data.

The following are definitions of the data qualifiers:

U Indicates the compound or analyte was analyzed for but not detected.

J Indicates an estimated value.

R Quality control indicates the data is not usable.

NJ Presumptive evidence of presence of the compound at an estimated quantity.

UJ Indicates the compound or analyte was analyzed for but not detected. The sample detection limit is an estimated value.

A Indicates the finding is based upon technical validation criteria.

P Indicates the finding is related to a protocol/contractual deviation.

None Indicates the data was not significantly impacted by the finding, therefore qualification was not required.

I. Technical Holding Times

All technical holding time requirements were met.

The chain-of-custodies were reviewed for documentation of cooler temperatures. All cooler temperatures met validation criteria.

II. Initial Calibration

All criteria for the initial calibration of each method were met.

III. Continuing Calibration

Continuing calibration frequency and analysis criteria were met for each method when applicable.

IV. Blanks

Method blanks were reviewed for each matrix as applicable. No contaminant concentrations were found in the initial, continuing and preparation blanks.

No field blanks were identified in this SDG.

V. Matrix Spike/Matrix Spike Duplicates

Matrix spike (MS) and matrix spike duplicate (MSD) samples were reviewed for each matrix as applicable. Percent recoveries (%R) and relative percent differences (RPD) were within QC limits.

VI. Duplicates

The laboratory has indicated that there were no duplicate (DUP) analyses specified for the samples in this SDG, and therefore duplicate analyses were not performed for this SDG.

VII. Laboratory Control Samples

Laboratory control samples were reviewed for each matrix as applicable. Percent recoveries (%R) and relative percent differences (RPD) were within QC limits.

VIII. Sample Result Verification

Raw data were not reviewed for this SDG.

IX. Overall Assessment of Data

Data flags are summarized at the end of this report if data has been qualified.

X. Field Duplicates

No field duplicates were identified in this SDG.

SUBJECT: DoDHF Novato, CA, Data Validation

Dear Ms. Cutie,

Enclosed is the final validation report for the fraction listed below. This SDG was received on January 2, 2015. Attachment 1 is a summary of the samples that were reviewed for each analysis.

LDC Project #33431:

SDG #	Fraction
1411348A	Volatiles

The data validation was performed under EPA Level III & IV guidelines. The analyses were validated using the following documents, as applicable to each method:

- USEPA Contract Laboratory Program National Functional Guidelines for Superfund Organic Methods Data Review, June 2008

Please feel free to contact us if you have any questions.

Sincerely,

Pei Geng
Project Manager/Senior Chemist

HC

**Indicates sample underwent EPA Level IV review

Introduction

This data review covers 27 air samples listed on the cover sheet including dilutions and reanalysis as applicable. The analyses were per EPA Method TO-15 for Volatiles.

This review follows a modified outline of the USEPA Contract Laboratory Program National Functional Guidelines for Superfund Organic Methods Data Review (June 2008).

A qualification summary table is provided at the end of this report if data has been qualified. Flags are classified as P (protocol) or A (advisory) to indicate whether the flag is due to a laboratory deviation from a specified protocol or is of technical advisory nature.

Samples indicated by a double asterisk on the front cover underwent an EPA Level IV review. An EPA Level III review was performed on all of the other samples. Raw data were not evaluated for the samples reviewed by EPA Level III criteria since this review is based on QC data.

The following are definitions of the data qualifiers:

U Indicates the compound or analyte was analyzed for but not detected.

J Indicates an estimated value.

R Quality control indicates the data is not usable.

NJ Presumptive evidence of presence of the compound at an estimated quantity.

UJ Indicates the compound or analyte was analyzed for but not detected. The sample detection limit is an estimated value.

A Indicates the finding is based upon technical validation criteria.

P Indicates the finding is related to a protocol/contractual deviation.

None Indicates the data was not significantly impacted by the finding, therefore qualification was not required.

I. Technical Holding Times

All technical holding time requirements were met.

The tedlar bags or canisters were properly pressurized and handled.

II. GC/MS Instrument Performance Check

Instrument performance was checked at 24 hour intervals.

All ion abundance requirements were met.

III. Initial Calibration

Initial calibration was performed using required standard concentrations.

Percent relative standard deviations (%RSD) were less than or equal to 30.0% for all compounds.

IV. Continuing Calibration

Continuing calibration was performed at the required frequencies.

All of the continuing calibration percent differences (%D) between the initial calibration RRF and the continuing calibration RRF were less than or equal to 30.0% .

The percent differences (%D) of the second source calibration standard were less than or equal to 30.0% for all compounds.

V. Blanks

Method blank analyses were performed at the required frequency. No volatile contaminants were found in the method blanks with the following exceptions:

Method Blank ID	Analysis Date	Compound TIC (RT in minutes)	Concentration	Associated Samples
1411348A-25A LB	11/23/14	Benzene Ethylbenzene Trichloroethene	0.33 ug/m^3 0.70 ug/m^3 0.51 ug/m^3	CSG-1A-11(6.0) CSG-1A-11(3.5) CSG-1A-9(6.5) CSG-1A-9(6.5)-DUP CSG-1A-9(3.5) CSG-1A-8(7.25)** CSG-1A-8(3.75) CSG-1A-6(6.0)** CSG-1A-6(2.9) CSG-1A-7(6.5) CSG-1A-7(3.5) CSG-1A-7(3.5)-DUP

Method Blank ID	Analysis Date	Compound TIC (RT in minutes)	Concentration	Associated Samples
1411348A-25B LB	11/29/14	Benzene Ethylbenzene Trichloroethene	0.33 ug/m^3 0.61 ug/m^3 0.59 ug/m^3	CSG-1A-1(6.5) CSG-1A-1(3.5) CSG-1A-2(6.5) CSG-1A-2(3.5) CSG-1A-4(3.5) CSG-1A-4(6.5)** CSG-1A-5(6.5) CSG-1A-10(4) CSG-1A-10(6.5) CSG-1A-10(6.5)-DUP CSG-1A-3(3.5)
1411348A-25C LB	12/1/14	Benzene Ethylbenzene Trichloroethene	0.33 ug/m^3 0.67 ug/m^3 0.69 ug/m^3	CSG-1A-5(3.5)

Canister blank analyses were performed for every sample canister. No volatile contaminants were found in the canister blanks.

Sample concentrations were compared to concentrations detected in the method blanks. The sample concentrations were either not detected or were significantly greater (>10X for common contaminants, >5X for other contaminants) than the concentrations found in the associated method blanks with the following exceptions:

Sample	Compound TIC (RT in minutes)	Reported Concentration	Modified Final Concentration
CSG-1A-11(6.0) (2.42X)	Benzene Trichloroethene	1.8 ug/m^3 0.79 ug/m^3	1.8U ug/m^3 0.79U ug/m^3

CSG-1A-5(3.5) (2.41X)	Benzene Trichloroethene	0.37 ug/m^3 0.78 ug/m^3	0.37U ug/m^3 0.78U ug/m^3

No field blanks were identified in this SDG.

VI. Surrogate Spikes

Although surrogates were not required by the method, surrogate analysis was performed by the laboratory. Surrogate recoveries (%R) were within QC limits.

VII. Matrix Spike/Matrix Spike Duplicates

Matrix spike (MS) and matrix spike duplicate (MSD) analyses were not required by the method.

Duplicate (DUP) sample analyses were analyzed at the required frequency. Results were within QC limits.

VIII. Laboratory Control Samples

Laboratory control samples were reviewed for each matrix as applicable. Percent recoveries (%R) and relative percent differences (RPD) were within QC limits.

IX. Regional Quality Assurance and Quality Control

Not applicable.

X. Internal Standards

All internal standard areas and retention times were within QC limits.

XI. Target Compound Identifications

All target compound identifications were within validation criteria for samples on which an EPA Level IV review was performed. Raw data were not evaluated for the samples reviewed by EPA Level III criteria.

XII. Compound Quantitation

All compound quantitation were within validation criteria for samples on which an EPA Level IV review was performed. Raw data were not evaluated for the samples reviewed by EPA Level III criteria.

XIII. Tentatively Identified Compounds (TICs)

Tentatively identified compounds were not reported by the laboratory.

XIV. System Performance

The system performance was acceptable for samples on which an EPA Level IV review was performed. Raw data were not evaluated for the samples reviewed by EPA Level III criteria.

XV. Overall Assessment of Data

Data flags are summarized at the end of this report if data has been qualified.

XVI. Field Duplicates

Samples CSG-1A-9(6.5) and CSG-1A-9(6.5)-DUP, samples CSG-1A-7(3.5) and CSG-1A-7(3.5)-DUP, and samples CSG-1A-10(6.5) and CSG-1A-10(6.5)-DUP were identified as field duplicates. No volatiles were detected in any of the samples with the following exceptions:

Compound	Concentration (ug/m^3)		RPD

LDC #: 33431A48 **VALIDATION COMPLETENESS WORKSHEET** Date: 1/16/15
SDG #: 1411348A Level III/IV Page: 1 of 1
Laboratory: Eurofins Reviewer: JC
2nd Reviewer:

METHOD: GC/MS Volatiles (EPA Method TO-15)

The samples listed below were reviewed for each of the following validation areas. Validation findings are noted in attached validation findings worksheets.

	Validation Area		Comments
I.	Technical holding times	A	Sampling dates: 11/12 - 13/14
II.	GC/MS Instrument performance check	A	
III.	Initial calibration	A	≤ 30 %
IV.	Continuing calibration/ICV	A	≤ 30 %
V.	Blanks	SW	
VI.	Surrogate spikes	NA	
VII.	Matrix spike/Matrix spike duplicates /LD	N/A	
VIII.	Laboratory control samples	A	LCS /D
IX.	Regional Quality Assurance and Quality Control	N	
X.	Internal standards	A	
XI.	Target compound identification	A	Not reviewed for Level III validation.
XII.	Compound quantitation/RL/LOQ/LODs	A	Not reviewed for Level III validation.
XIII.	Tentitatively identified compounds (TICs)	N	Not reviewed for Level III validation.
XIV.	System performance	A	Not reviewed for Level III validation.
XV.	Overall assessment of data	A	
XVI.	Field duplicates	SW	D = 3/4 ; 11/12 ; 22/23
XVII.	Field blanks	N	

Note: A = Acceptable; N = Not provided/applicable; SW = See worksheet; ND = No compounds detected; R = Rinsate; FB = Field blank; D = Duplicate; TB = Trip blank; EB = Equipment blank

Validated Samples: ** Indicates sample underwent Level IV validation

VALIDATION FINDINGS CHECKLIST

Reviewer: JVG
2nd Reviewer: (✓)

Method: Volatiles (EPA Method TO-15)

Validation Area	Yes	No	NA	Findings/Comments
I. Technical holding times				
All technical holding times were met.	✓			
Canister pressure criteria was met.	✓			
II. GC/MS instrument performance check				
Were the BFB performance results reviewed and found to be within the specified criteria?	✓			
Were all samples analyzed within the 12 hour clock criteria?	✓			
III. Initial calibration				
Did the laboratory perform a 5 point calibration prior to sample analysis?	✓			
Were all percent relative standard deviations (%RSD) ≤ 30% and relative response factors (RRF) > 0.05?	✓			
IV. Continuing calibration				
Was a continuing calibration standard analyzed at least once every 12 hours for each instrument?	✓			
Were all percent differences (%D) ≤ 30% and relative response factors (RRF) ≥ 0.05?	✓			
V. Blanks				
Was a method blank associated with every sample in this SDG?	✓			
Was a method blank analyzed at least once every 12 hours for each matrix and concentration?	✓			
Was there contamination in the method blanks? If yes, please see the Blanks validation completeness worksheet.	✓			
VI. Surrogate spikes				
Were all surrogate %R within QC limits?	✓			
If the percent recovery (%R) for one or more surrogates was out of QC limits, was a reanalysis performed to confirm samples with %R outside of criteria?			✓	
VII. Matrix spike/Matrix spike duplicates				
Was a matrix spike (MS) and matrix spike duplicate (MSD) analyzed for this SDG?			✓	
Were the MS/MSD percent recoveries (%R) and the relative percent differences (RPD) within the QC limits?			✓	
VIII. Laboratory control samples				
Was an LCS analyzed for this SDG?	✓			
Was an LCS analyzed per analytical batch?	✓			
Were the LCS percent recoveries (%R) and relative percent difference (RPD) within the QC limits?	✓			

LDC #: 33431 A48

VALIDATION FINDINGS CHECKLIST

Reviewer: JVG
2nd Reviewer:

Validation Area	Yes	No	NA	Findings/Comments
IX. Regional Quality Assurance and Quality Control				
Were performance evaluation (PE) samples performed?		✓		
Were the performance evaluation (PE) samples within the acceptance limits?			✓	
X. Internal standards				
Were internal standard area counts within +/-40% from the associated calibration standard?	✓			
Were retention times within +/- 30.0 seconds from the associated calibration standard?	✓			
XI. Target compound identification				
Were relative retention times (RRT's) within ± 0.06 RRT units of the standard?	✓			
Did compound spectra meet specified EPA "Functional Guidelines" criteria?	✓			
Were chromatogram peaks verified and accounted for?				
XII. Compound quantitation/CRQLs				
Were the correct internal standard (IS), quantitation ion and relative response factor (RRF) used to quantitate the compound?	✓			
Were compound quantitation and CRQLs adjusted to reflect all sample dilutions and dry weight factors applicable to level IV validation?	✓			
XIII. Tentatively identified compounds (TICs)				
Were the major ions (> 10 percent relative intensity) in the reference spectrum evaluated in sample spectrum?		✓		
Were relative intensities of the major ions within ± 20% between the sample and the reference spectra?		✓		
Did the raw data indicate that the laboratory performed a library search for all required peaks in the chromatograms (samples and blanks)?			✓	
XIV. System performance				
System performance was found to be acceptable.	✓			
XV. Overall assessment of data				
Overall assessment of data was found to be acceptable.	✓			
XVI. Field duplicates				
Field duplicate pairs were identified in this SDG.	✓			
Target compounds were detected in the field duplicates.	✓			
XVII. Field blanks				
Field blanks were identified in this SDG.		✓		
Target compounds were detected in the field blanks.			✓

The percent difference (%D) of the initial calibration average Relative Response Factors (RRFs) and the continuing calibration RRFs were recalculated for the compounds identified below using the following calculation:

% Difference = 100 * (ave. RRF - RRF)/ave. RRF
RRF = (Ax)(Cis)/(Ais)(Cx)

Where:
ave. RRF = initial calibration average RRF
RRF = continuing calibration RRF
Ax = Area of compound,
Cx = Concentration of compound,
Ais = Area of associated internal standard
Cis = Concentration of internal standard

LETTER FROM MARIN COUNTY DEPARTMENT OF ENVIRONMENTAL HEALTH SERVICES

Majors, Shawn M

From: McMullen, Dave <DMcMullen@marincounty.org>
Sent: Monday, September 21, 2015 3:36 PM
To: Majors, Shawn M
Cc: Callow, Scott
Subject: Hamilton AFB

Hello Sean,

I had a chance to talk to Scott Callow about a statement from our dept. as well as archive data.

Here is the statement:

County of Marin's Environmental Health Services is responding to a request for information from Sean Majors, Battelle Corporation, regarding the feasibility of ever installing a drinking water well in the area of the former Hamilton Air Force Base.

Based on historic use as an air force base, known groundwater contamination from military use as well as a leaking Underground Storage Tank at the fuel station, our department does not plan to issue water well drilling permits in the area in the future.

As far as archival records for future inquiries were are requesting a copy of your final report from you as we don't currently have a substantial amount of info on this.

If you haven't done so already, Scott recommends contacting the Regional Water Board's Ralph Lambert ralambert@waterboards.ca.gov for more information.

Thank you,

David McMullen

APPENDIX D

SUMMARY OF MODEL DEVELOPMENT AND RESULTS

TABLE OF CONTENTS

TABLE

FIGURES

D.1 INTRODUCTION

This appendix presents an evaluation of MTBE fate and transport in groundwater at Former Underground Storage Tank (UST) Site 957/970 at the Department of Defense Housing Facility (DoDHF) Novato in Novato, California. The purpose of the evaluation is to predict the time required for MTBE concentrations throughout the plume to fall below the California maximum contaminant level (MCL) of 13.0 μg/L under monitored natural attenuation (MNA) conditions. This appendix includes four primary sections: (1) MTBE background information, (2) the conceptual site model (CSM), (3) the description of the numerical groundwater flow and MTBE transport model and associated transport predictions, and (4) a summary of the evaluation.

D.2 MTBE BACKGROUND

This section presents MTBE background information, including a general description of MTBE use in fuel and MTBE fate and transport in the environment.

D.2.1 MTBE Use in Fuel

MTBE was used as a fuel oxygenate and octane booster in gasoline beginning in 1979. Initial MTBE concentrations were roughly 5% by volume. In response to amendments to the Federal Clean Air Act in 1990, MTBE concentrations were increased to 11% in most gasoline sold in California after October 1992 (Rhodes and Verstuyft, 2001). In 1996, over 95 percent of the gasoline used in California was blended with MTBE. The remainder was blended with ethanol, ethyl *tert*-butyl ether (ETBE), or tertiary amyl methyl ether (TAME) (California Air Resources Board [CARB], 1998). Although MTBE was effective as a fuel oxygenate, spills of MTBE-blended fuel (e.g., from leaking USTs) resulted in significant environmental impacts due to the toxicity of MTBE. The problem was exacerbated by the greater mobility and persistence of MTBE in the subsurface relative to other fuel compounds (e.g., benzene, toluene, ethylbenzene, and xylenes) (EPA, 2008). Due to increasing environmental and health concerns, the use of MTBE in gasoline in California was phased out by the end of 2003.

D.2.2 MTBE Fate and Transport

D.2.2.1 Sorption

MTBE is relatively mobile in the subsurface, only sorbing weakly to soil. For MTBE, the organic carbon partition coefficient (K_{oc}), a measure of the tendency for organic chemicals to sorb to soil, is approximately 10 mL/g. This is considerably less than the K_{oc} values of BTEX compounds: the K_{oc} for benzene is 85 mL/g, the K_{oc} for toluene is 166 mL/g, the K_{oc} ethylbenzene is 520 mL/g, and the K_{oc} values for individual xylene isomers (i.e., m-, p-, and o-xylene) range from 24 to 540 mL/g (Hazardous Substances Data Bank [HSDB], 2013). MTBE contamination in groundwater is thus more mobile than is BTEX contamination, and releases of MTBE-blended fuel in the subsurface therefore typically result in MTBE plumes that extend further downgradient than do the associated BTEX plumes.

D.2.2.2 Volatilization

MTBE has a high vapor pressure and will therefore readily volatilize from non-aqueous phase liquid (NAPL) above the saturated zone. However, MTBE has a low Henry's law constant and will therefore tend to remain in soil moisture and groundwater (American Petroleum Institute [API], 2007), rather than volatilizing into the air phase.

D.2.2.3 Degradation

Initial studies on the biodegradation of MTBE reported negative results (Fiorenza, et. al., 2002). However, MTBE and its intermediate degradation product, *tert*-butyl alcohol (TBA), have since been reported to biodegrade in both *in situ* and ex-situ studies, under a wide range of aerobic and anaerobic geochemical conditions, and examples of MTBE biodegradation are geographically widespread (API, 2007).

A literature survey (British Environmental Agency, 2002) concluded that MTBE anaerobic first-order degradation rates at hydrocarbon-contaminated sites range from 0.0035 to 0.00035 day^{-1} (a half-life of 0.54 to 5.4 years). The rate of degradation can vary significantly from site to site, and in some cases no biodegradation is observed (EPA, 2008).

Groundwater containing MTBE commonly has low dissolved oxygen because preferential biodegradation of other fuel components consumes oxygen. Slow field degradation of MTBE may reflect the rate of re-aeration of the groundwater. In field experiments, aerobic degradation rate constants of 0 to 0.007 day^{-1} (corresponding to no degradation to half-lives as short as 100 days) have been reported (EPA, 2008). In the laboratory, reported aerobic rate constants range from 0.07 to 0.001 day^{-1} (corresponding to half-lives of 10 to 700 days) (EPA, 2008).

The presence of TBA in MTBE-contaminated groundwater may indicate MTBE degradation because MTBE may be metabolized to TBA under both aerobic and anaerobic conditions (API, 2007). However, TBA has been used in parts of the United States as a fuel oxygenate and/or octane booster. In addition, TBA is a chemical intermediate of MTBE synthesis and can thus be present in trace amounts in fuel-grade MTBE. Therefore, the mere presence of TBA is not sufficient to infer MTBE degradation.

Available information indicates that TBA has not been used as a fuel oxygenate and/or octane booster in California (CARB, 1998). Additionally, TBA was not known to be used as of 2003 as a significant gasoline additive in the United States (DeVaull et al., 2003).

Due to the higher aqueous-phase solubility of TBA than MTBE, even trace quantities of TBA in fuel-grade MTBE can result in TBA concentrations that are comparable to MTBE concentrations in contaminated groundwater (Ellis, 2001).

D.2.2.4 Plume Sizes/Stability

A study conducted by BP Amoco of 45 MTBE plumes found a mean plume length of 140 ft using the 10 µg/L contour (Reisinger, et al., 2000). Using well-specific time series data, the authors determined that 4.4% of the MTBE plumes were expanding, 6.6% were stable, and 89% were contracting. Thus, nearly all (95%) of this large sample of MTBE plumes were stable or contracting.

A recent API technical bulletin (API, 2012) surveyed MTBE plume length and stability from a series of studies comprising over 400 gasoline release sites in multiple states. The survey found that MTBE plumes tend to stabilize at relatively short lengths (i.e., 90% less than 540 ft). Additionally, 75-90% of the MTBE plumes evaluated were stable or contracting at the time of the studies (approximately calendar year 2000).

D.3 CONCEPTUAL SITE MODEL

A detailed CSM of the site is presented in Battelle (2007) and is summarized in this section. This CSM integrates geologic, hydrogeologic, and contaminant data, and serves as the foundation for the present analysis of MTBE fate and transport at the site.

D.3.1 Regional Geology

The site lies within the Coast Range geomorphic province of northern California, which is characterized by subparallel mountain ranges, alluviated intermontane valleys, and active northwest-oriented strike-slip faults. Surface geology includes Quaternary sediments consisting of Bay Mud, alluvium, and colluvium that overlie Cretaceous Franciscan bedrock. The Franciscan bedrock is generally hard, massive, and slightly fractured. In several upland areas that surround the site, the Franciscan bedrock outcrops and forms isolated hills (e.g., Ammo Hill and Reservoir Hill).

D.3.2 Site Geology

At the site, an alluvial unit consisting of clays, silts, sands, and gravels, directly overlies a bedrock valley. In the upgradient area of the plume, boring logs indicate that the alluvial unit is highly heterogeneous, consisting of interfingered deposits of clay, silt, sand, and gravel. In the leading edge area of the plume, the alluvial unit consists of more homogeneous, discrete layers of sandy, silty, and clayey material. In this area, sand tends to immediately overlie the Franciscan bedrock. In turn, clayey materials (comprising the Bay Mud unit) tend to overlie the sands. In the Landfill 26 area, the alluvial unit is further overlain by a landfill refuse layer and cap material.

The uppermost bedrock unit at the site is the Franciscan Formation, a blue-gray, fine- to medium-grained sandstone. It has been slightly altered by metamorphism, sealing its primary porosity (U.S. Army Corps of Engineers [USACE], 1998). The sandstone is often weathered and fractured, creating secondary porosity, and the fractures are commonly filled by either calcite or silica material. The mapped top of bedrock elevation (Figure D-1) reveals a bedrock valley beneath the site. This valley is narrow in the UST source areas and broadens moving northward. The bedrock outcrops on the east side of the bedrock valley, forming Reservoir Hill. North of the leading edge of the plume, the bedrock also outcrops in the middle of the valley, forming Ammo Hill (Figure D-1). Bedrock is encountered at approximately 15 ft below ground surface (bgs) in the former UST source areas. The depth to bedrock increases moving northward, with bedrock encountered north of State Access Road at depths greater than 30 ft bgs.

D.3.3 Hydrogeology

The primary water-bearing zone at the site is the alluvial unit. Groundwater flow is generally from south to north (Figure D-2). Flow gradients are generally steeper in the southern portion of the plume area where the alluvial unit is thinner vertically and narrower west-to-east due to the structure of the bedrock valley. Flow gradients lessen to the north where the alluvial unit thickens and broadens, again due to the bedrock topography. The bedrock outcrop at Ammo Hill north of the plume leading edge causes groundwater flow in the alluvial aquifer to diverge to the northwest and northeast. Thus, the bedrock topography exerts significant control on groundwater flow in the area.

Groundwater recharge in the alluvial aquifer originates primarily from precipitation. In addition, significant groundwater flux is believed to occur from portions of the alluvial aquifer that are upgradient

of the site. Groundwater in the alluvial unit is unconfined in the southern portion of the plume and confined by the Bay Mud in the northern portion of the plume.

As noted in Section 0, metamorphism has reduced the primary porosity of the Franciscan bedrock at the site and the bedrock fractures are commonly filled by either calcite or silica material. As a result, the Franciscan Formation is not believed to be a significant source or transmitter of groundwater at the site. A handful of bedrock wells exist at the site, with water levels similar to those observed in adjacent alluvial wells. During sampling, the bedrock wells yield low water volumes, consistent with the belief that the bedrock is not a significant source or transmitter of groundwater at the site.

Hydraulic conductivity values in the alluvium from slug test data range from 0.4 ft/day to 20.7 ft/day.

Graphs of water level versus time were constructed for site monitoring wells (Attachment K1; on disc only) to assess water level fluctuations and to develop calibration targets for the groundwater flow model. These hydrographs reveal that groundwater elevations fluctuate by several feet seasonally, with higher groundwater elevations evident during the late winter and early spring months, corresponding to the regional rainy season. The June 2007 water level data were selected as model calibration targets because of a combination of (1) excellent site coverage (i.e., high number of wells measured versus other events), (2) water levels near the central tendency for each well based on hydrograph inspection, and (3) lack of anomalous measurements during this event. The June 2007 potentiometric surface is presented in Figure D-3.

D.3.4 MTBE History and Distribution at the Site

D.3.4.1 Timeline and Sources

MTBE contamination at the site originates from past releases of MTBE-blended fuel at former USTs 957 and 970. Currently, MTBE-impacted groundwater extends approximately 3,300 ft downgradient and north of the former southernmost source area associated with UST 970 (Figure D-4). The leading edge of the MTBE plume broadens as groundwater flow bifurcates around Ammo Hill.

Both USTs 957 and 970 were in operation from the mid-1970s to the early 1990s. As noted in Section 0, MTBE began to be used as a fuel oxygenate and octane booster in gasoline in 1979 and was phased out by the end of 2003. Thus, MTBE releases at USTs 957 and 970 may have occurred as early as 1979. Early site investigations identified significant MTBE impacts in the source areas as early as 1996. Monitoring wells installed progressively further northward had identified impacts in the leading edge area by roughly 1998 to 2000. Therefore, the MTBE travel time from the source areas to the leading edge was at most about 20 years (1979 to 2000) and may have been less depending upon the timing of the initial MTBE releases from USTs 957 and 970.

Continuing sources of MTBE contamination are not present in the plume area due to removal of the USTs and subsequent treatment in the UST source areas. Source area treatment included an air sparge and soil vapor extraction (SVE) system active from June 1998 to October 1999 in and downgradient of the UST 970 area. Subsequently, a biosparge system was active from September 2002 to March 2005 (continuously) and March 2006 to January 2009 (pulsed) in and downgradient of the UST 957 area.

D.3.4.2 Aqueous-Phase MTBE Plume

The current (November 2013) MTBE plume is presented in Figure D-4. The MTBE plume and MTBE trends over time are discussed in detail in Sections 2 and 3, respectively, of the main body of this report. The MTBE plume may be preferentially following a streambed channel that is suspected to have existed in the bedrock valley at the site. The centerline of the MTBE plume tends to mimic the centerline of the bedrock valley.

A key feature in the development and calibration of the model detailed in this appendix is the observed stability of the MTBE plume along the line depicted in Figure D-5. Upgradient of this line, similar MTBE impacts have been observed at monitoring wells screened at varying depths, with maximum concentrations along the plume centerline consistently in the hundreds of µg/L. In addition, the plume has migrated relatively quickly and steadily through the wells in this area. Historical sampling data indicate that MTBE arrived at IT-GMP-15, IT-PZ-9, IT-GMP-17, and IT-GMP-18 (located south to north along the plume centerline in the leading edge area) in 1998, 1998, 2000, and 2004, respectively. Following initial impact, MTBE concentrations in each of these wells increased steadily to the hundreds of µg/L over a period of four to six years (Figure D-5).

Given the concentration trends and timing of impacts in these wells, significant MTBE impacts would have been expected by the present at wells downgradient of the line in Figure D-5. However, little to no MTBE impacts have been observed at these sentry wells. At IT-GMP-19, approximately 200 ft downgradient of IT-GMP-18, MTBE was detected at low levels (0.4 µg/L) upon initial sampling in early 2005. Over the nearly nine-year period since, concentrations have increased marginally to less than 10 µg/L. Slightly further downgradient, MTBE has not been detected at IT-MW-81S (sampled from 2001 through 2012) and IT-MW-81D (sampled from 2001 through 2013). The recent air sparge treatment in the leading edge area occurred upgradient of IT-GMP-18 and years after the impacts in the wells noted above (IT-GMP-15, IT-PZ-9, IT-GMP-17, and IT-GMP-18); thus, the observed stability of the plume is independent of the air sparge system.

To the west of the plume centerline, the data are similar. Upgradient of the line in Figure D-5, MTBE arrived at monitoring well MW-M13 in 2000, with concentrations steadily increasing to about 100 µg/L within six years. Similar concentrations are observed at the co-located deeper well, MW-M13D, since sampling commenced there in 2005. Downgradient of MW-M13 and the line depicted in Figure D-5, MTBE was detected at low levels (0.4 µg/L) at monitoring well MW-M28 upon initial sampling in late 2005. Over the eight-year period since that time, concentrations at MW-M28 have only reached less than 1 µg/L.

Thus, the concentration versus time data on the upgradient side of the line indicate quick migration with consistent concentration patterns (i.e., in each well, concentrations steadily increase from initial impact to hundreds of µg/L over a four- to six-year period). On the other hand, data downgradient of the line indicate little to no impact and, where impacts are detected, insignificant concentration increase over a period of eight to nine years. Thus, the plume appears to be stable along the line indicated in Figure D-5. This is consistent with literature data indicating that the vast majority of MTBE plumes are presently stable to contracting (Section 0).

In some settings, apparent stability of this sort could be caused by a plume bypassing the downgradient sentry wells due to poor vertical placement of the sentry well screens. In this instance, however, the relatively uniform vertical distribution of contamination upgradient of the front (with maximum impacts in most wells in the hundreds of µg/L, regardless of screened interval) suggests that the sentry wells downgradient of the front (IT-GMP-19, IT-MW-81S, IT-MW-81D, and MW-M28) are unlikely to be bypassed by the plume due to the vertical location of their screens. Three of these wells (IT-GMP-19, IT-MW-81S, and MW-M28) are screened shallow, at depths similar to a number of upgradient impacted wells, including IT-GMP-18, IT-GMP-17, and MW-M13. One of these wells (IT-MW-81D) is screened

deeper, at a depth similar to a number of upgradient impacted wells, including LEA-MW1 through LEA-MW5. Thus, the data indicate that the plume is not bypassing the sentry wells but, rather, is stable at the line upgradient of the sentry wells indicated in Figure D-5.

It is also possible that the MTBE plume could follow preferential flowpaths and bypass the monitoring well network, moving primarily to the northeast and passing between IT-MW-81D/IT-MW-81S and MW-86S/MW-86D. However, slightly downgradient of these wells, MTBE had not been detected at wells IT-EW-91-03, IT-MW-88S/IT-MW-88D, and IT-EW-91-06 as of the most recent sampling in 2011. The Navy is currently coordinating with USACE to receive any recent monitoring data that may be available for these and other downgradient USACE wells. If such data reveal no significant MTBE impacts as expected, additional weight would be added to the argument that the plume is stable along the extreme leading edge.

Although the hydraulic gradient and therefore the groundwater flow velocity decrease through this area due to a thickening and broadening of the saturated alluvium, this alone is insufficient to account for the observed plume stability (as indicated by initial attempts to history-match the concentration trends over time in this area using the contaminant transport model, discussed subsequently in Section 0). The observed stability of the MTBE plume front is believed to be primarily attributable to a combination of enhanced MTBE degradation and increased sorption in this area. The former may be due to increased DO through this area of the aquifer, which could result from higher DO levels in focused recharge, including runoff from Landfill 26. The latter may be due to increased organic carbon in this area of the aquifer arising from geologic heterogeneity.

D.3.4.3 MTBE Degradation

Studies discussed in Section 0 indicate that MTBE degradation rates are highly variable from site to site. Available site-specific MNA data presented in Section 3 of the main text of this document indicate that MTBE degradation is occurring in at least some portions of the plume.

D.3.4.4 MTBE Sorption

As discussed in Section 0, MTBE is relatively mobile in the subsurface, only sorbing weakly to soil. Sorption of contamination to aquifer material is typically represented as an equilibrium process characterized by the distribution coefficient (K_d). In this approach, the sorbed- and dissolved-phase concentrations are assumed to be in equilibrium, and the sorbed-phase concentration divided by the dissolved-phase concentration is the equilibrium K_d. Site- and contaminant-specific K_d values may be determined experimentally. In addition, K_d values for organic compounds may be estimated based on the amount of organic carbon in the aquifer matrix because organics sorb predominantly to organic carbon in the subsurface. In the latter case, K_d is generally taken as the product of the organic carbon fraction in the matrix (f_{oc}) and the organic carbon partition coefficient (K_{oc}).

K_{oc} is a chemical-specific property available from literature. For MTBE, the K_{oc} is approximately 10 mL/g (HSDB 2013). Organic carbon fraction data are available for the sediments in the southern half of the site. Twenty-one measurements were performed for soil samples from 18 boreholes, with a median f_{oc} of 0.0011 kg/kg, or 0.11%. Together with a K_{oc} of 10 mL/g, this yields a K_d of 0.01 mL/g.

Aquifer effective porosity and bulk density also affect the degree of MTBE sorption. An effective porosity of 0.2 (unitless) and a dry bulk density of 1.5 g/cm^3 are reasonable values for heterogeneous alluvial materials (Argonne National Laboratory, 2013). From these values for K_d, effective porosity, and

dry bulk density, an MTBE transport retardation factor of 1.1 (unitless) may be calculated ($R_f = 1 + K_d*\rho_b/\eta_e$, where R_f is the retardation factor, ρ_b is dry bulk density and η_e is effective porosity). The retardation factor is the factor by which contaminant movement is slowed relative to groundwater flow due to sorption onto the subsurface matrix. Thus, given the values for the above aquifer properties (f_{oc}, ρ_b, η_e), MTBE transport at the site is slowed very little relative to groundwater flow.

D.3.5 Conceptual Site Model Summary

The site geology consists of an alluvial unit underlain by a bedrock valley. In the southern, upgradient area of the plume, boring logs indicate that the alluvial unit is highly heterogeneous, consisting of interfingered deposits of clay, silt, sand, and gravel. In the northern leading edge area of the plume, the alluvial unit consists of more homogeneous, discrete layers of sandy, silty, and clayey material. The bedrock valley underlying the alluvial unit is generally oriented north-south, with the bedrock valley wall outcropping on the east side of the site to form Reservoir Hill. Bedrock also outcrops to the north of the site in the middle of the valley to form Ammo Hill. The depth to bedrock generally increases moving from south to north.

The primary water-bearing zone at the site is the alluvial unit. Groundwater flow is from south to north (Figure D-2). Flow gradients are generally steeper in the southern portion of the plume area where the alluvial unit is thinner vertically and narrower west-to-east due to the structure of the bedrock valley. Flow gradients lessen to the north where the alluvial unit thickens and broadens, again due to the bedrock topography. The bedrock outcrop at Ammo Hill north of the plume leading edge causes groundwater flow in the alluvial aquifer to diverge to the northwest and northeast. Thus, the bedrock topography exerts significant control on groundwater flow in the area.

MTBE contamination at the site originates from past releases of MTBE-blended fuel at former USTs 957 and 970, which were in operation from the mid-1970's to the early 1990's. Currently, MTBE-impacted groundwater extends approximately 3,300 ft downgradient and north of the former southernmost source area (UST 970) (Figure D-4). The leading edge of the MTBE plume broadens as groundwater flow bifurcates around Ammo Hill. Continuing sources of MTBE contamination are not present in the plume area due to removal of the USTs and subsequent treatment in the UST source areas.

A key feature in the development and calibration of the model detailed in this appendix is the observed stability of the MTBE plume along the line depicted in Figure D-5. Upgradient of this line, similar MTBE impacts have been observed at monitoring wells screened at varying depths, with maximum concentrations along the plume centerline consistently in the hundreds of µg/L. In addition, the plume has migrated relatively quickly and steadily through the wells in this area. Given the concentration trends and timing of impacts in these wells, significant MTBE impacts would have been expected by the present at wells downgradient of the line in Figure D-5. However, little to no MTBE impacts have been observed at these sentry wells.

It is possible that the MTBE plume could follow preferential flowpaths and bypass sentry wells IT-GMP-19 and IT-MW-81S/IT-MW-81D, moving primarily to the northeast and passing between IT-MW-81D/IT-MW-81S and MW-86S/MW-86D. However, slightly downgradient of these wells, MTBE had not been detected at wells IT-EW-91-03, IT-MW-88S/IT-MW-88D, and IT-EW-91-06 as of the most recent sampling in 2011. The Navy is currently coordinating with USACE to receive any recent monitoring data that may be available for these and other downgradient USACE wells. If such data reveal no significant MTBE impacts as expected, additional weight would be added to the argument that the plume is stable along the extreme leading edge.

Available literature discussed in Section 0 indicate that MTBE degradation rates are highly variable from site to site. Available site-specific MNA data presented in Section 3 of the main text of this document indicate that MTBE degradation is occurring in at least some portions of the plume.

Sorption of MTBE to aquifer material is expected to be relatively low, given that MTBE sorbs weakly to soil and available data indicate that organic carbon in the alluvium at the site is relatively low. However, the observed stability of the MTBE plume at the extreme leading edge suggests that sorption is greater in this area.

D.4 NUMERICAL FLOW AND TRANSPORT MODEL

A numerical groundwater flow and MTBE transport model was constructed to assess future MTBE fate and transport. First, the conceptual model described above was translated into a numerical flow and transport model. Second, the model was used to reproduce key features of the current MTBE distribution. Third, the model was used to predict future MTBE fate and transport to support site decision-making. Each of these three major elements is discussed in the following subsections.

D.4.1 Groundwater Flow Model Development

D.4.1.1 Code Selection

MODFLOW-SURFACT, a proprietary version of USGS MODFLOW, was used for the flow model.

D.4.1.2 Model Grid and Layers

The model grid is presented in Figure D-6. All model cells are 50 feet by 50 feet, and the model dimensions are 4,400 feet by 2,600 feet. The model consists of one layer representing the alluvial aquifer at the site. The bottom of the model was specified using the top of bedrock surface (Figure D-1), and the top of the model was set to the site topography.

D.4.1.3 Boundary Conditions

Bedrock outcrops on the east and west side of the alluvial aquifer and at Ammo Hill were represented as no-flow boundaries in the model (Figure D-6). Inflow on the south end of the model and outflow on the north end of the model were specified using constant head cells with specified heads of 37 ft and 0 ft, respectively. These head values were based upon observed heads in the immediate area of these boundary conditions. Pumping is not expected to occur in the vicinity of these boundaries, so the use of constant heads (which can potentially provide infinite sinks/sources of water) is not problematic in these areas.

D.4.1.4 Hydraulic Conductivity

Based on the conceptual model, horizontal hydraulic conductivity (K_h) values are expected to be in the range of approximately 0.1 to 100 ft/day in the alluvial aquifer. During model calibration, the K_h distribution was adjusted within this range in order to calibrate the flow model.

The vertical hydraulic conductivity (K_v) was set at $0.1*K_h$, consistent with standard groundwater flow modeling practice.

D.4.1.5 Recharge

Recharge in this model is used to represent the net infiltration of precipitation to the saturated zone, minus evapotranspiration. A base recharge value of 2 in/yr was specified throughout the active area of the model, with the exception of the Landfill 26 area. In this area, the recharge was reduced to 0.5 in/yr to reflect the reduction of infiltration due to the landfill cap.

D.4.1.6 Flow Model Calibration

Model calibration is the process of adjusting model input parameters (e.g., hydraulic conductivity and boundary conditions) in order to reproduce field observations (e.g., heads at monitoring wells) with the model. Successful model calibration increases confidence that the model is a reasonable representation of the physical system and can be used to make predictions to support site decision-making.

Site observation data available for calibration of this flow model include monitoring well water level observations discussed in the conceptual model section. The model K_h distribution was systematically adjusted using PEST (Doherty, 2010) until these water level observations at the site were reproduced within the model under steady-state flow conditions. The calibrated K_h distribution is presented in Figure D-7.

To assess calibration, the difference (or residual) between observed head and the simulated head at the corresponding model location is calculated. These head residuals are posted on Figure D-8 and a scatterplot of simulated versus observed heads is provided in Figure D-9. Figure D-8 shows little spatial bias in the head residuals, while Figure D-9 shows little error bias with magnitude of head. For a calibrated model, the mean of the head residuals should be near zero (indicating little overall model bias) and the standard deviation of the residuals divided by the range of head observations should be less than 10% (indicating residuals are generally tightly clustered near zero). The calibration statistics are presented in Table D-1. The mean head residual is -0.15 ft and the standard deviation of the residuals divided by the range of head observations is 2.57%, both indicating acceptable head calibration.

D.4.2 Contaminant Transport Model Development

The flow model described in the preceding section provides the foundation for the contaminant transport model because contaminants are transported advectively with groundwater flow. In addition, the transport model includes representation of physical processes specific to MTBE transport. These are described in the following subsections.

D.4.2.1 Code Selection

The code used for the flow model (MODFLOW-SURFACT) was also used for the contaminant transport model.

D.4.2.2 MTBE Sources

Differing MTBE sources were specified in the model, depending upon the purpose of each model simulation, as follows:

- For the purpose of calibration simulations that attempt to recreate the MTBE travel times from USTs 957 and 970 to the plume leading edge (see Section 0), MTBE releases were represented in the model using a constant concentration source cell at each UST. An MTBE concentration of 500,000 µg/L was used for each of the constant concentration cells, a slightly higher concentration than the maximum observed at the site (240,000 µg/L in November 1996 at 970-MW4, 100 to 200 ft downgradient of the former NEX station and UST 970).
- For the purpose of calibration simulations that attempt to reproduce the migration of the downgradient half of the plume from 2002 to 2010 (see Section 0), continuing MTBE sources were not specified in the model.

- For the purpose of prediction of future transport of the current MTBE plume (see Section 0), continuing MTBE sources were not specified in the model, consistent with the CSM.

D.4.2.3 Initial MTBE Plume

Differing initial MTBE plumes were specified in the model, depending upon the purpose of each model simulation, as follows:

- For the purpose of calibration simulations that attempt to recreate the MTBE travel times from USTs 957 and 970 to the plume leading edge (see Section 0), no initial MTBE plume was specified in the model.
- For the purpose of calibration simulations that attempt to reproduce the migration of the downgradient half of the plume from 2002 to 2010 (see Section 0), the downgradient half of the observed November 2002 MTBE plume was specified in the model.
- For the purpose of prediction of future transport of the current MTBE plume (see Section 0), the observed November 2013 MTBE plume was specified in the model.

D.4.2.4 MTBE Degradation

Available literature discussed in Section 0 indicate that MTBE degradation rates are highly variable from site to site. Available site-specific MNA data presented in Section 3 of the main text of this document indicate that MTBE degradation is occurring in at least some portions of the plume.

MTBE degradation rates were varied during model calibration simulations to attempt to reproduce observed transport timing and patterns. Ultimately, for the purpose of transport modeling, degradation was conservatively assumed not to occur throughout the majority of the plume, with the exception that a first-order degradation rate of 0.69 yr^{-1} (corresponding to a half-life of 1 yr) was specified downgradient of the plume stability front (see line in Figure D-5). The degradation rates developed during model calibration were then used in the prediction of future transport of the current MTBE plume.

D.4.2.5 MTBE Sorption

Sorption of contamination to aquifer material is typically represented as an equilibrium process characterized by the distribution coefficient (K_d). In this approach, the sorbed- and dissolved-phase concentrations are assumed to be in equilibrium, and the sorbed-phase concentration divided by the dissolved-phase concentration is the equilibrium K_d.

Site- and contaminant-specific Kd values have not been determined experimentally for the site. However, the MTBE K_d may be estimated from the product of the organic carbon fraction in the matrix (f_{oc}) and the organic carbon partition coefficient (K_{oc}). As discussed in Section 0, this yields an estimated K_d of 0.01 mL/g for MTBE.

Aquifer effective porosity and bulk density also affect the degree of MTBE sorption. The effective porosity in the model was set at 0.2 (unitless) and the dry bulk density at 1.5 g/cm^3, both reasonable values for heterogeneous alluvial material (Argonne National Laboratory, 2013).

Using these values for K_d, effective porosity, and dry bulk density, an MTBE transport retardation factor of 1.1 (unitless) may be calculated (Section 0). This retardation factor indicates that MTBE transport at the site is slowed very little relative to groundwater flow.

The estimated K_d of 0.01 mL/g was adjusted during model calibration to attempt to reproduce observed transport timing and patterns. Ultimately, a K_d of 0.01 mL/g was specified throughout the majority of the plume, with the exception that a K_d of 0.25 mL/g was specified downgradient of the plume stability front (see line in Figure D-5). This K_d distribution developed during model calibration was then used in the prediction of future transport of the current MTBE plume.

D.4.2.6 MTBE Dispersion

Dispersion is the spreading of contaminants in the saturated zone resulting from a combination of mixing (due to local velocity variations) and diffusion. Dispersion is represented in numerical modeling via specification of the dispersivity parameter(s). For two-dimensional flow and transport, these include the longitudinal dispersivity, and transverse horizontal dispersivity. Site-specific dispersivity data are not available for the study area. Literature values are available, but dispersivity has frequently been shown to be scale-dependent (Schulze-Makuch, 2005), meaning that the appropriate value is proportional to plume size. In an analysis of published longitudinal dispersivity data from 109 authors, an empirical power law was developed relating longitudinal dispersivity to the flow distance for various geologic media (Schulze-Makuch, 2005). Using the power law developed for unconsolidated sediments and a flow distance of 3,300 ft, a longitudinal dispersivity on the order of 10 ft may be estimated. The transverse horizontal dispersivity is typically specified as an order of magnitude less than the longitudinal dispersivity. Thus, for this model, longitudinal and transverse horizontal dispersivities of 10 ft and 1 ft were used.

D.4.2.7 MTBE Transport Model Calibration

As with flow model calibration, MTBE transport model calibration involves adjusting model input parameters (e.g., K_d, degradation, etc.) to reproduce field observations (e.g., observed MTBE concentrations at monitoring wells). Again, successful model calibration increases confidence that the model is a reasonable representation of the physical system and so can be used to make predictions to support site decision-making.

Site observation data available for calibration of this transport model include the MTBE groundwater quality data discussed in the conceptual model section. The primary input parameters adjusted during calibration of the solute transport model were the K_d value for MTBE and the MTBE degradation rate.

Calibration of the solute transport model focused on (1) reproducing travel times from the source areas to the leading edge of the plume and (2) history-matching of MTBE transport in the downgradient half of the plume from November 2002 to November 2010.

The MTBE travel time from the source areas to the leading edge was at most about 20 years (1979 to 2000) and may have been less depending upon the timing of the initial MTBE releases from USTs 957 and 970 (see Section 0). As described in preceding sections, constant concentration cells were specified at each of USTs 957 and 970, and no initial MTBE plume was specified for these simulations. An MTBE concentration of 500,000 µg/L was used for each of the constant concentration cells, a slightly higher concentration than the maximum observed at the site (240,000 µg/L in November 1996 at 970-MW4, 100 to 200 ft downgradient of the former NEX station and UST 970). Using a K_d of 0.01 mL/g and conservatively assuming no degradation, MTBE was predicted to reach the leading edge area in five to ten years at concentrations similar to those observed there. This is consistent with the CSM that the travel time was at most 20 years.

History-matching of MTBE transport in the downgradient half of the plume from November 2002 to November 2010 was then performed. In general, history-matching of MTBE transport during the last 15 years is complicated by the various remedial systems at the site, including:

- an air sparge and soil vapor extraction (SVE) system active from June 1998 to October 1999 in and downgradient of the UST 970 area,
- a biosparge system active from September 2002 to March 2005 (continuously) and March 2006 to January 2009 (pulsed) in and downgradient of the UST 957 area,
- an air sparge system active from December 2010 to December 2011 in the leading edge area.

Modeling the effects of these systems on past MTBE fate and transport would introduce additional variables and uncertainty into model calibration. Consequently, the effects of these remedial systems were sidestepped during the model calibration process by focusing on the northern half of the plume (which is downgradient of the older two remedial systems) and by focusing on the time period prior to operation of the leading edge air sparge system (i.e., prior to December 2010). November 2002 was selected as the starting point for this history-matching effort, as this is a relatively early event with comprehensive monitoring well data coverage.

In initial simulations for the history-matching effort, MTBE was consistently predicted to migrate much farther downgradient by 2010 than was observed. This is directly related to the observation that the MTBE plume front is stable along the line depicted in Figure D-5 (Section 0). Although site potentiometric maps typically indicate that the hydraulic gradient decreases across this line, this alone is insufficient to account for the observed plume stability, as indicated by initial history-matching attempts. The observed stability is believed to be primarily attributable to a combination of enhanced MTBE degradation and increased sorption downgradient of the line depicted in Figure D-5 (Section 0). Enhanced degradation may be due to increased DO through this area of the aquifer, which could result from higher DO levels in focused recharge, including runoff from Landfill 26. Increased sorption may be due to increased organic carbon in this area of the aquifer arising from geologic heterogeneity.

Both increased degradation rates and increased sorption were incorporated into the flow and transport model in this area in order to reproduce the observed contaminant transport patterns in the area from 2002 to 2010. Using a K_d of 0.25 mL/g and an MTBE first-order degradation rate of 0.69 yr^{-1} (corresponding to a half-life of 1 yr) downgradient of the line in Figure D-5, the observed November 2010 MTBE distribution in the downgradient half of the plume was able to be reproduced with the model (Figure D-10). Upgradient of the plume stability line (i.e., in the majority of the plume area), the K_d was maintained at 0.01 mL/g and MTBE was conservatively assumed not to degrade, as in the previous history-matching of MTBE transport from the source areas to the leading edge.

These successful transport model calibration steps increase confidence that the model is a reasonable representation of the physical system and so can be used to make predictions to support site decision-making.

D.4.3 Prediction of Future MTBE Fate and Transport

Using the calibrated flow and transport model, the current MTBE plume was modeled forward in time to predict the time until the MTBE MCL will be met throughout the plume. Consistent with the site conceptual model, continuing MTBE sources were not specified in this forward simulation. The November 2013 MTBE plume was used to specify initial concentrations in the model for this simulation. Otherwise, model transport parameters were identical to those used in the calibrated transport model (Section 0). In particular, MTBE was conservatively assumed not to degrade, except in the area downgradient of the plume stability front, where an MTBE first-order degradation rate of 0.69 yr^{-1} (corresponding to a half-life of 1 yr) was specified. A K_d of 0.01 mL/g was used in the majority of the model area, and a K_d of 0.25 mL/g was used downgradient of the plume stability front. Under these

baseline conditions, model simulations predict that maximum MTBE concentrations will decrease to the MTBE MCL in approximately 15 years (Figure D-11).

In addition to this baseline simulation, sensitivity simulations were executed to predict the time until the MTBE MCL will be met using decreased MTBE degradation and sorption in the area where the plume is currently observed to be stable. In this area, the K_d was reduced from 0.25 mL/g to 0.1 mL/g and the MTBE first-order degradation rate was decreased from 0.69 yr^{-1} to 0.069 yr^{-1} (corresponding to a half-life increase from 1 yr to 10 yr). Upgradient of the plume stability line, the K_d was maintained at 0.01 mL/g and MTBE was conservatively assumed not to degrade, as in the baseline simulation. For these transport parameters, model simulations predict that plume stability is no longer maintained (contrary to current observations) and the MTBE MCL will be met in 20 to 25 years (Figure D-12).

D.5 SUMMARY AND RECOMMENDATIONS

D.5.1 Summary

This appendix presents an evaluation of MTBE fate and transport in groundwater at Former UST Site 957/970 at DoDHF Novato in Novato, California. The primary focus of the evaluation is to predict the time required to achieve the California MTBE MCL of 13.0 µg/L under MNA conditions. The following sections summarize the CSM and the numerical flow and transport model developed from the CSM.

D.5.1.1 Conceptual Site Model

The site geology consists of an alluvial unit underlain by a bedrock valley. In the southern, upgradient area of the plume, boring logs indicate that the alluvial unit is highly heterogeneous, consisting of interfingered deposits of clay, silt, sand, and gravel. In the northern leading edge area of the plume, the alluvial unit consists of more homogeneous, discrete layers of sandy, silty, and clayey material. The bedrock valley underlying the alluvial unit is generally oriented north-south, with the bedrock valley walls outcropping on the east sides of the site, forming Reservoir Hill. Bedrock also outcrops to the north of the site in the middle of the valley, forming Ammo Hill. The depth to bedrock generally increases moving from south to north.

The primary water-bearing zone at the site is the alluvial unit. Groundwater flow is from south to north (Figure D-2). Flow gradients are generally steeper in the southern portion of the plume area where the alluvial unit is thinner vertically and narrower west-to-east due to the structure of the bedrock valley. Flow gradients lessen to the north where the alluvial unit thickens and broadens, again due to the bedrock topography. The bedrock outcrop at Ammo Hill north of the plume leading edge causes groundwater flow in the alluvial aquifer to diverge to the northwest and northeast. Thus, the bedrock topography exerts significant control on groundwater flow in the area.

MTBE contamination at the site originates from past releases of MTBE-blended fuel at former USTs 957 and 970, which were in operation from the mid-1970s to the early 1990s. Currently, MTBE-impacted groundwater extends approximately 3,300 ft downgradient and north of the former southernmost source area (UST 970) (Figure D-4). The leading edge of the MTBE plume broadens as groundwater flow bifurcates around Ammo Hill. Continuing sources of MTBE contamination are not present in the plume area due to removal of the USTs and subsequent treatment in the UST source areas.

The MTBE plume is observed to be stable along the line indicated in Figure D-5 (see discussion in Section 0). Upgradient of this line, similar MTBE impacts have been observed at monitoring wells screened at varying depths, with maximum concentrations along the plume centerline consistently in the hundreds of µg/L. In addition, the plume has migrated relatively quickly and steadily through the wells in this area. Given the concentration trends and timing of impacts in these wells, significant MTBE impacts would have been expected by the present at wells downgradient of the line in Figure D-5. However, little to no MTBE impacts have been observed at these sentry wells.

D.5.1.2 Numerical Flow and Transport Model

The CSM summarized above was used as the framework for developing the flow and transport model. The flow and transport model includes one layer, representing the unconsolidated deposits at the site. Thus, the bottom of the model corresponds to the top of weathered bedrock. The groundwater flow

model was calibrated under steady-state flow conditions to observed June 2007 water levels. Two phases of history-matching were then performed with the contaminant transport model: reproduction of travel times from the source areas to the plume leading edge and reproduction of contaminant transport patterns in the northern half of the plume from 2002 to 2010. During the latter transport model calibration step, MTBE degradation and sorption were increased north of the line at the leading edge of the plume in Figure D-5, in order to successfully reproduce the observed plume stability in this area from 2002 to 2010. Successful execution of these flow and transport model calibration steps lends confidence to the use of the model to predict future contaminant transport.

The calibrated flow and transport model was then used to predict future MTBE transport, starting with the November 2013 MTBE plume. Model simulations predict that maximum MTBE concentrations will decrease to the MTBE MCL in approximately 15 years (Figure D-11). Sensitivity simulations were also conducted using decreased MTBE degradation and sorption in the area where the plume is observed to currently be stable. Under these simulations, plume stability is no longer maintained (contrary to current observations) and the predicted time to achieve the MTBE MCL is increased to 20 to 25 years (Figure D-12).

D.5.2 Recommendations

The Navy is currently coordinating with USACE to receive any recent monitoring data that may be available for USACE monitoring wells downgradient of the MTBE plume. Data through 2011 for these wells are presently available to the Navy and indicate no MTBE impacts. If more recent data reveal no significant MTBE impacts as expected, additional weight would be added to the argument that the plume is stable along the extreme leading edge.

DRAFT FINAL SITE CLOSURE REPORT, REQUEST FOR NO FURTHER ACTION, FORMER UST SITE 957/970, FORMER DEPARTMENT OF DEFENSE HOUSING FACILITY NOVATO, MARIN COUNTY

Dear Mr. Doctor:

The California Department of Toxic Substances Control (DTSC) has reviewed the subject document (DF Closure/NFA Request), dated 30 March 2016, and has determined it satisfactorily addressed the comments DTSC provided on the DF Closure Report/NFA Request, dated September 2015; therefore, DTSC has no further comments.

However, DTSC notes that per the agreement reached between DTSC, San Francisco Bay Regional Water Quality Control Board (SFBRWQCB), U.S. Environmental Protection Agency - Region 9, and the Naval Facilities Engineering Command in a 09 December 2015 conference, and reiterated in a 04 May 2016 e-mail from Ms. Margarete Beth SFBRWQCB, formal concurrence by the lead agency for California (SFRWQCB) will be provided, if appropriate, after the Hamilton Square soil remediation is complete so that all parcels can be closed at one time.

If you have any questions, please contact me at (916) 255-3714 or email me at Terry.Escarda@dtsc.ca.gov.

Sincerely,

Terry M Escarda

Subject: Comments, Draft Final Site Closure Report Request for No Further Action, Former UST Site 957/970, Former Department of Defense Housing Facility, Novato, Marin County

Dear Mr. Doctor:

San Francisco Bay Regional Water Quality Control Board (Regional Water Board) staff has reviewed the *Draft Final Site Closure Report Request for No Further Action, Former UST Site 957/970, Former Department of Defense Housing Facility, Novato, California* (Draft Final NFA), dated March 30, 2016.

Regional Water Board staff offers the following comments:

1. The Draft Final NFA should include an brief explanation as to why the TPHg concentration level in well NA-7 has not decreased since 2006. The concentration level for TPHg in well NA-7 has actually increased to 4,400 µg/L in 2015 from 4,200 µg/L in 2006. Although TPHg concentration levels have decreased overtime from 30,000 µg/L to 4,400 µg/L, the concentration level has basically remained the same during the last 10 years. It appears a hot spot may still exist at that location.
2. Please explain why TPHg analysis was not conducted in monitoring wells MP-1D, MW-1E, and MW-M3, which are located down-gradient of well NA-7.
3. The Draft Final NFA should include figures depicting the TPHg and TPHd concentrations in soil at the UST 970 location or explain why the Draft Final NFA does not include such figures. The NFA includes figures depicting TPHd/g concentrations in soil at the UST 957 area, but not the UST 970 area.

4. Please ensure that each table clearly identifies the UST location for which the data represents. For example, Table 11 presents soil data for the Oil/Water Separator, but it doesn't indicate if it is for the UST 957 area or the UST 970 area.
5. All tables should include the most recent ESL[1] for each contaminant of concern and media (e.g. groundwater, soil) for comparison. Some of the tables include ESLs that do not reflect the most recent ESL value.

If you have any questions, please contact me at (510) 622-2338 or by e-mail at margarete.beth@waterboards.ca.gov.

Sincerely,

Margarete "Maggie" Beth
Environmental Scientist
Groundwater Protection Division

Former Department Of Defense Housing Facility Novato, Novato, California
July 2016

Comment No.	Comments	Navy Response
San Francisco Regional Water Quality Control Board Comments		
1.	The Draft Final NFA should include a brief explanation as to why the TPHg concentration level in well NA-7 has not decreased since 2006. The concentration level for TPHg in well NA-7 has actually increased to 4,400 µg/L in 2015 from 4,200 µg/L in 2006. Although TPHg concentration levels have decreased overtime from 30,000 µg/L to 4,400 µg/L, the concentration level has basically remained the same during the last 10 years. It appears a hot spot may still exist at that location.	The 2015 TPH-G concentrations in NA-7 of 4,400 µg/L suggest residual TPH-G is present at this location. However, it is important to note that downgradient, well 957-MW4 screened (8-18 ft bgs) in the same interval as NA-7 (10-15 ft bgs) was non-detect, suggesting that the residual TPH-G is not migrating and natural bioattenuation mechanisms are occurring to degrade petroleum-related products and resulting in a low threat to human health and safety and to the environment.
2.	Please explain why TPHg analysis was not conducted in monitoring wells MP-1D, MW-1E, and MW-M3, which are located down-gradient of well NA-7.	These wells were not sampled because MP-1D was abandoned in 2010 and MW-1E and MW-M3 were abandoned in 2013. Figure 5: TPH-G Plume Contour Map (November 2006 and December 2015) and Table 6: TPH-G Concentrations in Groundwater (2006 and 2015) have been updated accordingly.
3.	The Draft Final NFA should include figures depicting the TPHg and TPHd concentrations in soil at the UST 970 location or explain why the Draft Final NFA does not include such figures. The NFA includes figures depicting TPHd/g concentrations in soil at the UST957 area, but not the UST 970 area.	Figures depicting soil TPH-D and TPH-G concentrations in soil at the UST 970 location were not included in the Draft Final NFA because that parcel has been transferred to a private developer and is currently undergoing a remedial action to remove residual COCs in soil at this location by a separate contractor to achieve soil cleanup standards for residential development. Figures depicting the TPH-G and TPH-D concentration in soil at the UST 970 location are available in the *Final Remedial Investigation Report For Former UST Site 957/970 at Department of Defense Housing Facility Novato, California* (Battelle, 2001).
4.	Please ensure that each table clearly identifies the UST location for which the data represents. For example, Table 11 presents soil data for the Oil/Water Separator, but it doesn't indicate if it is for the UST 957 area or the UST 970 area.	The following tables have been updated accordingly. Table 5 lists the locations for each of the monitoring wells. Tables 10, 11, 12 identify UST locations. Tables 13 and 14 list the location in the header. Tables 15 and 16 identify the location in a column.
5.	All tables should include the most recent ESL1 for each contaminant of concern and media (e.g. groundwater, soil) for comparison. Some of the tables include ESLs that do not reflect the most recent ESL value.	All tables have been updated accordingly with the 2016 ESLs.

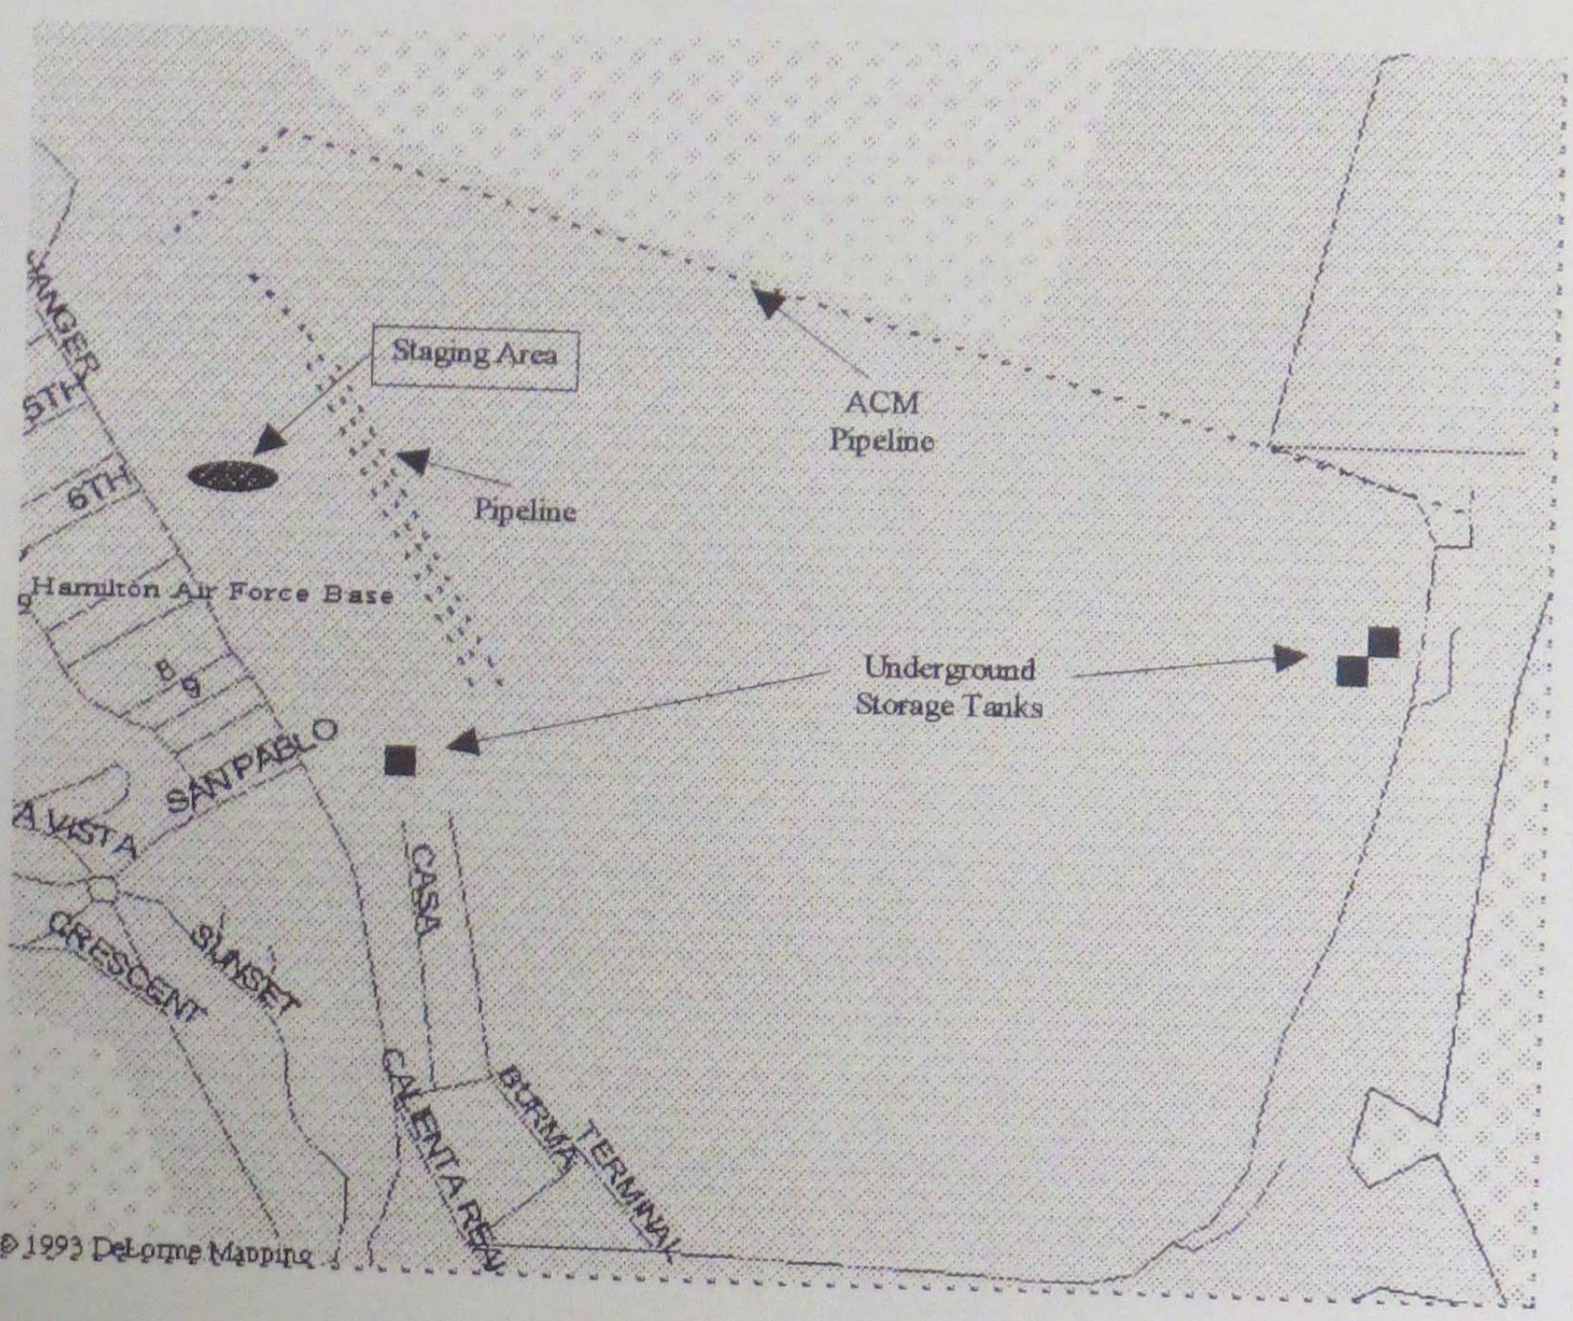
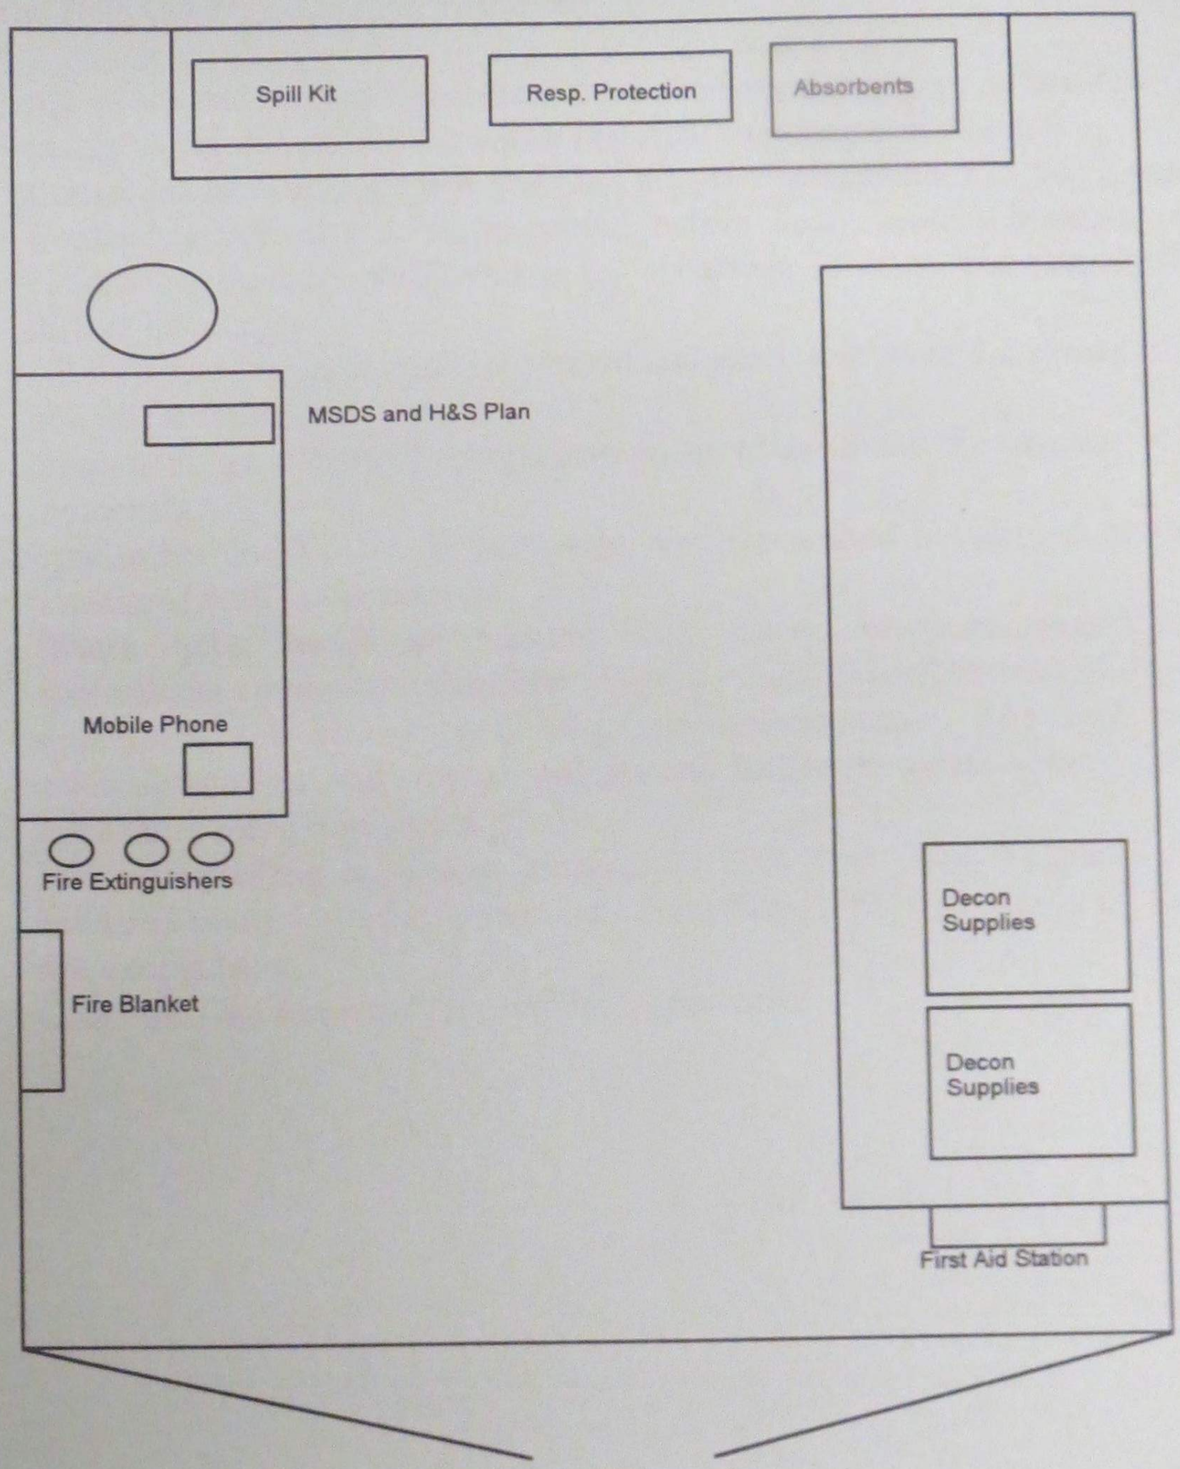
EVACUATION ROUTES AND SAFE DISTANCES



Due to the extended nature of the project site, evacuation routes will be established prior to each days operations. A central rally point located at the office trailer (staging area) will be used for all evacuations. Standard practice will require all routes to account for prevailing winds and terrain and access roads. All egress routes will be noted and posted at the project staging area each day.

FIGURE 10.2

SITE MAP WITH EMERGENCY EQUIPMENT LOCATED



SUPPLY TRAILER

All materials used in the project will be stored at the staging area in the supply trailer mobilized to the site by ATG. Materials will be staged at the appropriate location for each days activities to allow ease of access in the event of an emergency.

PERMIT FOR TEST HOLES / SOIL BORINGS

Date of Issuance: May 4, 2010
Date of Expiration: May 4, 2011

To: David Clark, Remedial Project Manager
Naval Facilities Engineering Command
1220 Pacific Highway
San Diego, CA 92132-5190

Permit No.: TH 09/10 – 36 (35)

Street Address: DOD Housing Facility

City: Novato

Assessor's Parcel Number:

Driller: Gregg Drilling and Testing, Inc., 950 Howe Road, Martinez, CA 94553

Your application and plans have been reviewed for compliance with relevant California State and Marin County regulations. Permission is hereby granted to perform the stated work at the above, designated site.

In order to provide the necessary inspections and/or to prevent rescheduling the well driller, the well driller shall notify this office in person at least **two working days** in advance of drilling the well. The grout shall not be placed until approval from Environmental Health Services is granted. If arrangements other than an inspection are made and approved before drilling, then documentation on the methods and materials used to destroy the hole shall be submitted within 30 days of drilling.

CONDITIONS:

1. Construction and destruction criteria shall meet all applicable sections of the current State of California Water Well Standards Bulletin 74 (as revised).
2. Unless approved by EHS beforehand, the well driller shall seal with a cement grout and have a pump and tremie system available in the event that groundwater is discovered.
3. The holes shall be sealed ASAP, especially in the event of rain, to prevent contamination of the groundwater by surface water.
4. If the boring is drilled on property owned by a party other than the applicant, this permit is not valid until applicable local encroachment permits or permissions are first obtained. Please contact the appropriate landowner, city, county, park or special district agencies to obtain permissions.
5. The Marin County CUPA (Office of Waste Management, Department of Public Works) or the local L.P.A. shall be notified whenever test results from sampling demonstrate chemical contamination or leakage of underground storage tanks.

This permit is valid for twelve months from the date of issuance. If work has not commenced prior to the expiration date, an additional application and the associated fee shall be required.

Issued by,

Steve Rosso, R.E.H.S.

CALIFORNIA REGIONAL WATER QUALITY CONTROL BOARD
SAN FRANCISCO BAY REGION

TENTATIVE ORDER

ADOPTION OF SITE CLEANUP REQUIREMENTS FOR:

UNITED STATES NAVY

for the property located at the

DEPARTMENT OF DEFENSE (DoD) HOUSING FACILITY
former HAMILTON AIR FORCE BASE
NOVATO, CALIFORNIA
MARIN COUNTY

The California Regional Water Quality Control Board, San Francisco Bay Region (hereinafter Board), finds that:

1. **Site Location**: The Site is located within the Department of Defense (DoD) Housing Facility (DODHF-Novato), at Hamilton Air Force Base on the eastern edge of the City of Novato, Marin County, California. It includes an approximate 65-acre rectangular area where petroleum was released from leaking underground, fuel storage tanks associated with two former gasoline service stations. As depicted on Attachment A, the rectangular area which defines the Site is bound on the north by the former Hamilton Army Airfield (HAAF) property line, on the south by Main Entrance Road, on the west by the DoDHF-Novato property line to State Access Road and projected northward to the former HAAF property line, and on the east by a north-south trending line located approximately 400 ft east of, and parallel to C Street.

2. **Site History:** Originally, the DoDHF-Novato property was part of HAAF. HAAF was constructed between 1932 and 1935 and encompassed approximately 927 acres. In 1947, HAAF was transferred to the U.S. Air Force and was renamed Hamilton Air Force Base (HAFB). By 1964, additional housing to the west of the airfield increased the size of HAFB to 2,184-acres. In 1974, the U.S. Air Force deactivated the facility and initiated transfer of excess property; residential housing units were transferred to the Navy in 1975 as DoDHF-Novato, and the remaining property was transferred to various federal agencies.

From the mid-1970s through the early 1990s, the Navy operated two service stations at the DODHF-Novato. The first service station, Building 957, contained a 12,000-gallon underground storage tank (UST) designated UST-957 (see Attachment A). In March 1992, Building 957 UST and associated piping were removed. Analytical results for soil and

groundwater samples collected from the excavation detected significant concentrations of total petroleum hydrocarbons (TPH) as gasoline, and benzene, toluene, ethylbenzene, and xylene compounds.

The second service station, called the Naval Exchange Service Station (NEX), operated from the mid-1970s through the mid-1990s. The NEX was located in Building 970, at the northwest corner of "Main Entrance" Road and "C" Street (see Attachment A). In the early 1990s, when the NEX was closed, three single-walled, steel 10,000-gallon USTs, which formerly contained unleaded gasoline, and one 1,000-gallon waste oil UST were removed. The three gasoline USTs were located approximately 70 ft south of Building 970 and were designated UST-970-1, UST-970-2, and UST-970-3.

Between 1995 and 1996, UST-970-1, UST970-2, UST-970-3, and 80 feet of piping leading from the tanks to the pump islands were removed. Although UST-970-1 and UST-970-2 were observed to be in good condition at the time of their removal, UST 970-3 contained a hole at the fill end of the tank, groundwater was encountered at two feet below ground surface (bgs), and hydrocarbon contamination was observed on the excavation sidewalls and tank pit groundwater. Analytical results for soil and groundwater samples collected from the excavation detected significant concentrations of total petroleum hydrocarbons (TPH) as gasoline, diesel, motor oil, jet fuel, benzene, toluene, ethylbenzene, xylenes and methyl tertiary butyl ether (MTBE).

MTBE-impacted groundwater originating in the vicinity of the former USTs flows northward, onto the adjacent HAAF parcel, which is currently owned by the City of Novato. MTBE-impacted groundwater seasonally discharges to Pacheco Creek (See Attachment A).

3. **Named Dischargers**: The United States Navy (Navy) is named as the discharger because it owns the property and owned the property during the time of the activity that resulted in the discharge. The Navy had knowledge of the discharge or the activities that caused the discharge, and had the legal ability to prevent the discharge.

   Navy reports that it expects to transfer the Site to the City of Novato in June 2000. If the property is transferred to the City, or to any other party or parties, anyone acquiring the property will be added to this Order.

4. **Regulatory Status:** This site is currently not subject to Board order.

5. **Site Hydrogeology:** Groundwater at the Site occurs within unconfined, unconsolidated alluvial materials and generally flows northward. In the area of the Site, the unconfined alluvial aquifer rests on top of eroded and fractured basement rock. In the past two years, depth to groundwater in the immediate vicinity of former UST-970-3 has ranged between 7

EXECUTIVE SUMMARY

The U.S. Department of the Navy (Navy) has been identifying and evaluating past releases of chemical contaminants at various sites located at the Department of Defense (DOD) Housing Facility, Novato, California. Controlling and eliminating the spread of contaminants from these sites continues to be the Engineering Field Activity West, Naval Facilities Engineering Command's primary environmental mission. This report documents the Naval Command, Control and Ocean Surveillance Center Research, Development, Test and Evaluation (NCCOSC RDT&E) Division Site Characterization and Analysis Penetrometer System (SCAPS) activities conducted at the former DOD Housing Facility Naval Exchange (NEX) Service Station and presents data, conclusions, and recommendations regarding the site.

The SCAPS xenon chloride and nitrogen laser-induced fluorescence (LIF) systems were developed by NCCOSC RDT&E Division, in conjunction with the U.S. Army and Air Force, as screening methods for identifying the presence of petroleum hydrocarbons in soil and groundwater. Polynuclear aromatic hydrocarbons (PAHs) in petroleum products are induced to fluoresce by excitation with ultraviolet laser light emitted from a monochromatic laser at 308 nanometers (xenon chloride) and 337 nanometers (nitrogen). The resulting LIF response is used as a field screening measure of the presence or absence of petroleum hydrocarbons.

The SCAPS deployment at the DOD Housing Facility, Novato consisted of 19 xenon chloride LIF, 4 nitrogen LIF, 4 cone penetrometer test (CPT) stab soil sampling and 9 CPT groundwater sampling pushes. The results of the SCAPS investigation are intended to give the Navy information regarding the subsurface conditions at the site and to support development of remedial options for the site.

The results of the SCAPS investigation show that:

(1) Elevated levels of total petroleum hydrocarbons as gasoline (TPHG); benzene, toluene, ethylbenzene, and total xylene isomers (BTEX); and methyl tertiary butyl ether (MTBE) exist in groundwater between the area of the former underground storage tanks (USTs) excavation (at the south boundary of the site) to the Public Works Yard (the furthest north location investigated).

(2) The spread of groundwater contamination has been influenced by shallow bedrock to the south, east and west. The hydrocarbon plume appears to be "channelized" by the lower permeability of the shallow bedrock, directing the plume in a downgradient direction with limited cross-gradient dispersion.

(3) The possible presence of an unknown additional source of a gasoline release in the northern portion of the site or in the recreational vehicle storage yard cannot be ruled out based on the observed groundwater contaminant concentrations.

The SCAPS information collected appears sufficient to initiate formulation of a risk-based corrective action plan for the site reflecting the property's future use as a residential area. Based on our understanding of the Navy's requirements for expedited site cleanup, corrective action options include the removal of heavily contaminated soils from immediately downgradient of the existing UST excavation, potentially followed by installation and/or operation of an in situ system to remediate dissolved BTEX and MTBE in the groundwater underlying the northern portion of the site.

Attention: Ms. Judy Grant,

Subject: Total Environmental Restoration Contract (TERC) DACW05-95-D-0001;
Delivery Order No. 0002, Hamilton AAF GSA Phase I Property
Lot 10 Building 431/439 Area Rapid Response Excavation Plan

Dear Ms. Grant:

IT Corporation has prepared this letter to present the approach for Rapid Response remediation activities of contaminated soil associated with the of petroleum hydrocarbon contaminated soil in the Lot 10 Building 431/439 area of the General Services Administration (GSA) Phase I Sale Area. The remediation activities will conducted in accordance Errata III of the *Corrective Action Plan, GSA Phase I Sale Area, Hamilton Army Airfield* (Woodward Clyde Federal Services, 1995) prepared by Woodward-Clyde on August 07, 1998. This letter provides a summary of the investigation activities and laboratory analytical results of soil samples collected during the investigation which has identified the boundaries of the contaminated soil, and an excavation plan based on the analytical results. This letter has been prepared under the TERC Contract DACW05-95-D-0001, Delivery Order No. 0002.

Background and Investigation Summary

On August 04, 1998, Taylor-Woodrow Homes, Inc notified the Army that contamination had been discovered on their property, the former GSA Phase I Sale Area Lot 10. As part of site development, grading operations were being performed in the area between former Buildings 431 and 439 (Taylor-Woodrow Homes, Inc. Lot Nos. 134, 135, 136, 137, and 138) when petroleum hydrocarbon odors were detected (Figure 1). A soil sample was collected by ENGEO from the soil that appeared to contain petroleum hydrocarbons and was submitted to Superior Analytical Laboratory for chemical analyses on July 27, 1998. The sample was analyzed for total petroleum hydrocarbons (TPH) by EPA Method 8015, purgeable aromatic hydrocarbons by EPA Method 8020, volatile organic compounds (VOCs) by GS/MS EPA Method 8240, semi-volatile organic compounds, including polynuclear aromatic hydrocarbons (PNAs), by EPA Method 8270, and CAM 17 metals.

The metals analyses results were all within the range of background and below GSA Phase I Sale Area Residential Cleanup Goals. All of the organic compounds detected were also below GSA

Phase I Sale Area Residential Cleanup Goals with the exception of TPH-purgeable at 2,400 mg/kg and TPH-extractable at 8,400 mg/kg. In response to these findings, IT Corporation was given the directive by the Army to conduct a Rapid Response Investigation at this location.

On August 13-14, 1998, four trenches (LT10-TR-001, -002, -003, and -004) were excavated in a pattern radiating outward from the area where contamination was initially discovered by Taylor-Woodrow Homes, Inc (Figure 2). Each trench was approximately 40-feet long and excavated to a depth just below the Bay Mud-Fill contact (typically 5 to 7 feet below ground surface). Groundwater was encountered in all four trenches and pumped into a Baker tank located near the trenches.

Soil samples were collected from the Bay Mud-Fill contact and from the trench floor at 20 feet (Station 20+00) and 40 feet (Station 40+00) along each trench from the point of origin (Figures 2). Soil samples were collected using a decontaminated slide hammer immediately after excavating to the appropriate depth. After sampling, each trench was lithologic logged. All trenches were backfilled immediately after logging was completed. All the soil samples collected were sent to Chroma Lab and analyzed for TPH-purgeable by EPA Method 8015 (for gasoline), TPH-extractable by EPA Method 8015 (for JP-4, diesel, and motor oil). Soil samples collected at Station 20+00 were analyzed for polynuclear aromatic hydrocarbons (PNAs) by EPA Method 8270, and only samples were petroleum hydrocarbons were detected (namely, Trench LT10-TR-003, Station 20+00) were analyzed for VOCs by EPA Method 8260. A composite soil sample for waste characterization purposes, which was to be collected from the trench spoil piles per Errata III, was not collected at the request of the USACE. Water samples were collected from the Baker tank. Table 1 shows the analytical results from the soil and water samples.

A summary of the results from the samples collected for the Lot 10 Rapid Response is as follows:

- For TPH as gasoline the detected concentrations ranged from 1.05 mg/kg to 5.5 mg/kg for an unknown hydrocarbon in trench LT10-TR-003. These detections are below the GSA Phase I Sale Area Residential Cleanup Goal of 100 mg/kg for gasoline. These samples were collected at the 20-foot mark and at 5 feet and 7 feet below ground surface, respectively.

- For TPH as JP-4 and motor oil, analyses indicated concentrations were below detection limits.

- TPH-diesel was detected in one sample from LT10-TR-003 at a concentration of 590 mg/kg. The detected value of 590 mg/kg is above the GSA Phase I Sale Area Residential Cleanup Goal of 200 mg/kg for diesel.

LEGEND:

Approximate area to be excavated. All equipment piping, foundations, tanks, etc. shall be removed within these areas.

GENERAL NOTES:

1. Contractor shall provide off-site borrow & fill/rubble areas. No on-site borrow or disposal areas available for this project.
2. Contractor shall provide temporary construction/safety fences around all excavations and permanent "snow fence" around excavations left open after tank removal.

ASTM E-1527-13 PHASE I ENVIRONMENTAL SITE ASSESSMENT PRE-SURVEY QUESTIONNAIRE AND DISCLOSURE STATEMENT

Site Contact: Please complete this questionnaire before the Consultant's site visit. For those questions that are not applicable to the subject please respond with an "N/A". This document must be signed by the Owner or his/her representative (Item No. 2). If you have any questions about how to answer any of the questions please call Transaction Management Corporation (TMC). If additional pages for response are necessary please attach them to this form. Clearly mark all references to the appropriate question number(s). This document and your written response to same will be an exhibit in TMC's report.

1. PROPERTY INFORMATION:

Property Name: **HUD Parcel**		
Property Address: 826 State Access Rd.		
City: Novato	State: CA	Zip: 94949
Assessor's Parcel Number: 157-970-07		

2. COMPLETED BY

Signature	Date 1/4/2019
Printed Name: PAUL FORDHAM	Title: DEPUTY EXECUTIVE DIRECTOR

3. ASTM-REQUIRED INQUIRIES

Property Owner: Name: City of Novato - Homeward Bound has an E.R.N – attached Phone: (415) 382-3363 x.211 Fax:	
Key Site Manager (Site contact): Name: Paul Fordham Phone: (415) 382-3363 x.211 Fax:	
If not residential Property, please provide list of tenants, including contact names and phone numbers.	
Are you aware of any environmental cleanup liens against the property that are filed or recorded under federal, tribal, state or local law. If so, please documents along with completed questionnaire to TMC	☐ Yes ☒ No
Are you aware of any Activity Use Limitations (AULs) such as engineering controls, land use restrictions or institutional controls that are in place at the site and/or have been filed or recorded in a registry under federal, tribal, state or local law? If so, please send documents along with completed questionnaire to TMC	☐ Yes ☒ No
Do you have any specialized knowledge or experience related to the property or nearby properties? For example, are you involved in the same line of business the current or former occupants of the property or an adjoining property so that you would have specialized knowledge of the chemicals and processes used by this type of business?	☒ Yes ☐ No
Do you have any specialized knowledge that would be material in identifying recognized environmental conditions in connection with the Property?	☒ Yes ☐ No
Does the purchase price being paid for this property reasonably reflect the fair market value of the property? If you conclude that there is a difference, have you considered whether the lower purchase price is because contamination is known or believed to be present at the Property?	☒ Yes ☐ No
Are you aware if commonly known or reasonably ascertainable information about the property that would help the environmental professional to identify conditions indicative of releases or threatened releases?	☒ Yes ☐ No

Please return completed form and any attachments via fax to:
Transaction Management Corporation, 2415 San Ramon Boulevard #4-306, San Ramon, CA 94582
Telephone: 925-353-3824 Fax: 925-905-1926

For example: Do you know the past use of the property? Do you know specific chemicals that are present or once were present at the property? Do you know of spills or other chemical releases that have taken place at the property? Do you know of any environmental cleanups that have taken place at the property?	
Based on your knowledge and experience related to the property are there any obvious indicators that point to the presence or likely presence of contamination at the property?	☒ Yes ☐ No

Please attach explanation of all affirmative answers.

8) Please state reason for procuring this Phase 1 ESA:

☐ Qualify for Innocent Landowner defense to CERCLA Liability.

☒ Other: (state below)

We have an ERN and are seeking to obtain a 99-year ground lease from the City of Novato, which requires a CEQA. Also, we are pursuing government funds and city approvals to create affordable housing and a job training center on this site. This all requires a Phase 1 ESA

4. PLEASE PROVIDE A GENERAL SITE DESCRIPTION BY COMPLETING THE FOLLOWING TABLE:

Legal description/ boundary survey/ plat available (please send to TMC if "yes") **Parcel number 157-970-07. Boundary map in attached ERN**	☒ Yes ☐ No
Total Property Size 2.6 acres	
Total number of buildings 3	
Total square footage of buildings ?	
Date of construction ?	
Dates of significant renovation None	
Waste water discharge ☐ Provide name ☐ On-site septic system ☐ Other	
Potable water source ☐ Provide name ☐ On-site well ☐ Other	
Please describe prior use of property, if known: **Warehouses on the commissary triangle of the former Hamilton Military Base**	

5. PREVIOUS INVESTIGATIONS:

Have any previous environmental investigations been performed at the site? ☐ Yes ☒ No	
INVESTIGATION TYPE **If yes, please describe conclusions, and attach copy of report(s)**	
☐ Phase 1 ESA	
☐ Phase 2 ESA	
☐ Tank Tightness Testing	
☐ Asbestos Survey/ O&M	
☐ Radon	
☐ Lead-based Paint	
☐ Lead in Water	
☐ Operations & Maintenance Plan(s)	
☐ Other	

6. ON SITE OPERATIONS

Are you aware of any of the following conditions, either past or present, on the site?		
Condition	**Response**	**If yes, please describe**
1. Stored Chemicals	☐ Yes ☒ No	
2. Underground Storage Tanks	☐ Yes ☒ No	
3. Aboveground Storage Tanks	☐ Yes ☒ No	
4. Spills or Releases	☐ Yes ☒ No	
5. Dump Areas/ Landfills	☐ Yes ☒ No	
6. Waste Treatment Systems	☐ Yes ☒ No	
7. Clarifies/ Separators	☐ Yes ☒ No	
8. Air stacks/ Vents/ Odors	☐ Yes ☒ No	
9. Floor Drains/Sumps	☐ Yes ☒ No	
10. Stained Soil/ Impacted Vegetation	☐ Yes ☒ No	
11. On-site OWNED Electrical Transformers	☐ Yes ☒ No	
12. Hydraulic lifts/ Elevators	☐ Yes ☒ No	
13. Dry Cleaning Operations	☐ Yes ☒ No	
14. Wetlands/ Flooding	☐ Yes ☒ No	
15. Oil/ Gas/ Water/ Monitoring Wells	☐ Yes ☒ No	
16. Environmental Cleanups	☐ Yes ☒ No	

17. Environmental Permits	☐ Yes ☒ No	If yes, please describe and ATTACH ALL COPIES of permits. Please attach last three waste manifests.
a) Industrial Discharge	☐ Yes ☐ No	
b) POTW (NPDES)	☐ Yes ☐ No	
c) Hazardous Waste Generator	☐ Yes ☐ No	
d) Air Quality	☐ Yes ☐ No	
e) Flammable Materials	☐ Yes ☐ No	
f) AST/UST	☐ Yes ☐ No	
g) Waste Manifest(s)	☐ Yes ☐ No	
h) Other	☐ Yes ☐ No	

7. OFF SITE ENVIRONMENTAL CONCERNS

Are you aware of any of the following conditions, either past or present, Adjacent to the site?		
Condition	**Response**	**If yes, please describe**
Gasoline Stations	☐ Yes ☒ No	
Dry Cleaners	☐ Yes ☒ No	
Industrial Uses	☐ Yes ☒ No	
Other	☐ Yes ☒ No	

APPENDIX F

OTHER SUPPORTING DOCUMENTATION

QA/QC – 1

Specific Issues - Indicate whether your investigation identified **CURRENT OR PAST** environmental concerns relating to any of the following specific environmental issues.

Y/N	Issue	Y/N	Issue
N	Above Ground Storage Tank(s)	**N**	Underground Storage Tank(s)
N	Clarifiers	N	Fill or Evacuation Ports
N	Vent Pipes	N	Fuel Islands
N	Drums	N	Other Containers
N	Surface Staining	N	Solid Waste Disposal
N	Sumps	N	Pits
N	Ponds	N	Lagoons
N	Stockpiled Soils	N	Distressed Vegetation
N	Oil or Gas Wells	Y	Monitoring Wells
N	Domestic Water Wells	N	Dry Wells
N	Underground Pipelines	N	Chemical Processes
N	Waste Treatment	N	Hazardous Waste Storage
N	Septic Systems	N	Waste Water Discharge
N	Dry Cleaners	N	Repair or Servicing Facilities
N	Photo Processing	N	Manufacturing
N	Distribution Warehouse	**N**	Asbestos Containing Materials
N	High Radon Levels	N	Suspect Lead Containing Paint
N	Lead in Water	N	Others
N	Is/was heating fuel provided by on-site storage fuel oil?	N	On-site use, disposal, treatment, storage, or emission, of significant quantities of hazardous materials or wastes.
N	Evidence of any on-site release of hazardous materials, which could impact the Property?	N	Evidence of any off-site release of hazardous materials, which could impact the Property.

The following items should be evaluated to assist in determining the potential for fungi and bacteria contamination. Check YES, NO, NA (Not Applicable), or NI (Not Inspected.) Include a description of answers which result in recommendation for correction or additional evaluation under Homeward Bound of Marin's guidelines.

Interview – Is the owner/operator aware of:	**YES**	**NO**
1. Current or past flood damage?		X
2. Current or past water leaks?		X
3. Past abatement or correction of conditions involving mold?		X
4. Complaints of symptoms common to mold response?		X
5. Current or past allegations of mold-related ailments, sick building syndrome or similar condition?		X

Inspection	**YES**	**NO**	**NA**	**NI**
6.0 Roof				
6.1 Is there any visible mold present?				X
6.2 Is the roof in good condition?				X
6.3 Are roof vents blocked?				X
7.0 Heating Ventilation and Air Conditioning - Air intake vents				
7.1 Is there any evidence of mold on or around the air intake?		X		
7.2 Is there evidence of standing water near the air intake?		X		
7.3 Is there any accumulation of organic materials near the air intake?		X		
7.4 Is the air intake screened?	X			
7.5 Is the air intake blocked?		X		
7.6 Is there a cooling tower located within 25 feet of the air intake?		X		
8.0 Heating Ventilation and Air Conditioning - Air Handling				
8.1 Is there evidence of mold in, on or around an air handling unit?		X		
8.2 Are return air filters moldy, dirty or blocked?		X		
8.3 Is there standing water in or around the air handling units?		X		
9.0 Ductwork and Plenums				
9.1 Are return air ducts and plenum clean?	X			
9.2 Are supply ducts clean?	X			
9.3 Was mold observed in supply or return air ducts or plenum?		X		
10.0 Building Exterior				
10.0 Did you observe staining or discoloration of the building exterior which is not an intended finish and did not appear to result from rust?		X		
10.2 Is there a musty smell or strong odor present?		X		
10.3 If the building has an underground sprinkler system, do sprinklers direct water away from the building?		X		
10.4 Does the exterior slope away from the building?	X			
10.5 Are crawlspace vents blocked?		X		
11.0 Building Interior				
11.1 Is there any visible mold present?		X		
11.2 Is there a musty smell or strong odor present?		X		
11.3 Did you observe staining or discoloration of the floor, walls, ceiling, fixtures or finish materials?		X		
11.4 Did you observe evidence of current or past water leaks?		X		
11.5 Did you observe crumbling or degrading of walls or ceilings?		X		
11.6 Did you observe bubbling or swelling of painted surfaces?		X		
11.7 Are sewer injectors located in the building?			X	
a) Do they appear to be working properly?			X	

Homeward Bound of Marin specifically recognizes that, though the individual completing this inspection is a trained observer of real estate, recognizing, detecting, and measuring the presence of mold may be beyond the scope of her/his expertise. Neither the individual completing this inspection, nor the firm engaged in completion of this assignment has any liability for the identification of mold-related concerns except as defined in applicable industry standards.

QUALIFICATIONS OF ENVIONMENTAL PROFFESIONAL

DARIUSH DASTMALCHI, R.E.P.A.
2415 San Ramon Valley Boulevard, Suite 4-306
San Ramon, CA 94583

PROFESSIONAL EXPERIENCE

Managed property condition assessments (PCA), probable maximum lose (PML), and loan servicing inspections (LSI) throughout the United States. Prepared proposals to conduct the above services, primarily for large financial institutions such as Banks, and Loan Servicing Companies. Assisted the institutions in resolving their transactional issues. Negotiated with over 200 subcontractors to complete the assignments and projects within the allocated time and financial goals. Completed all projects on or before set deadlines and within the allotted profit and loss (P&L) margins.

Managed environmental compliance audits, and assessments (Phase I), subsurface investigations and site characterizations (Phase II), and soil and groundwater remediations (Phase III). Prepared proposals to conduct Phase I, II, and III environmental investigations. Prepared design specifications for Phase II and III environmental investigations. Managed nonregulated and hazardous waste handling and disposal.

SELECTED PROJECT EXPERIENCE

- **Public Utilities** - Managed and conducted environmental audits and assessments of an electrical utility company in Colorado. The assessments and the audits were conducted at more than 100 facilities throughout the State of Colorado. The facilities included electricity generation plants, tank farms, PCB processing facilities, transfer stations, substations, and other associated facilities. The assessments were performed to identify the areas of potential noncompliance with local, state, federal and permit requirements. In addition the assessments determined if the operations at the sites posed an environmental threat to the surface and/or subsurface conditions at the facilities.

- **Private Industry** - Conducted Phase I, Phase II and Phase III for a car dealership in Dublin, California. The Phase I investigation revealed that two underground storage tanks (USTs) were previously removed from the site. The subsequent subsurface investigations revealed that the soil and the groundwater beneath the site were contaminated with petroleum hydrocarbons. A work plan for soil and groundwater remediation was prepared and submitted to the overseeing agency for approval.

  Supervised the remediation activities, which included removal of the contaminated soil for aeration and onsite biodegradation. Designed a groundwater treatment system to remediate approximately 30,000 gallons of groundwater onsite. After completion of the soil and groundwater remediation a case closure was issued by the Regional Water Quality Control Board, San Francisco Region (RWQCB), and the Alameda County for the site. The remediation system designed for the site resulted in over $100,000 in savings to the client.

- **State Government** - Designed and supervised the remediation of lead- and zinc-contaminated soil at a California Superfund site in Stockton, California. Developed a work plan based on the California Department of Health Services (DHS) requirements. Supervised strict implementation of the heath safety plan prepared for the approximately 15 employee directly involved in the remediation activities.

Contaminated soil was stabilized to immobilize lead and zinc that had been identified at the site in concentrations greater than DHS-accepted exposure levels for children and women of child-bearing age.

The soil was stabilized by microencapsulating the heavy metal contaminants with the proprietary chemical Chloranan™ and pozzolanic materials. The remediation technology was evaluated and approved by the United States Environmental Protection Agency (EPA) under their Superfund Innovative Technology Evaluation (SITE) program. The remediation activities were completed in August 1990 and the site was removed from the State Superfund list in 1991.

- **Municipal Government -** Managed subsurface investigations and the subsequent groundwater remediations at a City and County of San Francisco MUNI facility. The subsurface investigations included installation and sampling of permanent and temporary wells and well points. The remediation activities included design and installation of a skimmer system to remove floating products from beneath the site. The skimmer system was designed with the total fluid extraction capabilities to allow for the future groundwater remediation. Interacted with regulatory agencies to approve and permit subsurface investigations, groundwater discharges, and remediation activities.

- **Real Estate Industry** - Managed or performed over 4000 property transaction environmental assessments at commercial, industrial, agricultural, residential, and undeveloped properties throughout the United States. The assessments included limited compliance audits and asbestos and radon surveys. The assessments were performed to ensure that all appropriate inquiries have been made into present and past ownership and uses of the properties in an effort to minimize environmental risks and liabilities. All assessments were completed within budget and before deadlines.

EMPLOYMENT

Transaction Management Corporation, Inc. November, 2007 to Present
LandAmerica Assessment Corporation (National Assessment Corp.) July 1998 to October 2007
Accutite Environmental Engineering, July 1997 to July 1998
Growth Resources, Inc., June 1996 to July 1997
Clayton Environmental Consultants, Inc., October 1989 to May 1996
Trace Analysis Laboratory, Inc., February 1987 to October 1989.
Union Oil of California (UNOCAL 76), June 1986 to February 1987

EDUCATION

Graduate Studies, Geology, Sep. 1984 - Jun. 1986
California State University
Fresno, California

B.S. Geology, May 1984
Southwest Missouri State University
Springfield, Missouri

PROFESSIONAL REGISTRATION/CERTIFICATION

Registered Environmental Assessor in California No. 03136
Certified AHERA Inspector
OSHA 40-hour Hazardous Materials Safety Certification
OSHA 8-hour Supervisory Certification
Groundwater Hydrology Seminar, University of California, Davis
Groundwater Pollution and Hydrology, The Princeton Course
